Federal judge was right to strike down Obama fracking rules

Federal judge strikes down fracking regulations on federal land
State primacy is best solution for environmental regulation
Industry must continue to improve its environmental impact
In striking down the Obama administration’s hydraulic fracturing rule that would have put more regulations on “fracking” on federal lands, Judge Scott Skavdahl in the U.S. District Court of Wyoming got it right for the environment.

When it comes to oil and gas production, each state is different because the geology, regulatory frameworks, infrastructure, economics, industries, tax laws and political climate are different. One size does not fit all.

State regulators and policymakers have more experience, expertise and local knowledge than the federal government.
Thus, states are better at ensuring that industry, government and other stakeholders work together to produce oil and gas; protect the land, water and air; disclose the composition of fracking fluids; and provide a local tax base that allows for further environmental protection in the state.

State primacy is the best solution for the environment in this case and other issues as well.

Should agricultural practices in Florida follow the exact standards as those in Oregon? Should Colorado be told it cannot sell marijuana? Should New York be required to allow fracking in the Marcellus Shale?

Are there cases where federal regulation makes sense? Of course. For example, particulate pollution or safety standards for food, both of which cross state boundaries.

Is the state oil and gas regulatory process perfect? Of course not. That is why state regulators share best practices and experiences and are always improving.

Are all states prepared to regulate oil and gas? No.

But does that justify the Interior Department’s statement that Judge Skavdahl’s ruling “prevents regulators from using 21st century standards to ensure that oil and gas operations are conducted safely and responsibly on public and tribal lands”?

No, it does not.

There are local, and mostly temporary, effects of drilling, such as increased noise, dust, road damage and lights.

On rare occasion, wells can leak methane through surface casing designed to protect groundwater; valves can leak methane; and surface storage pits can leak water.

Also on rare occasions, pressure from disposal of produced water deep in the earth can cause a natural fault to shift sooner than it would have on its own, creating a low-magnitude earthquake.

Are these environmental impacts acceptable? No. The industry must continue to improve, and it does.

Are the impacts large-scale and systemic? No. They are local, and they are the exception.

Of course, understanding the rarity doesn’t help if such an event happens in your back yard, any more than would contamination from an industrial-scale chicken farm or a chemical battery, fertilizer or solar-panel manufacturing plant.

Do we have energy options better than oil and natural gas that can be deployed immediately? Some say yes, but that is mostly a political answer.

As we consider energy, the economy and the environment, and how to improve all three, it is best to remain objective, fact-based and educated.

When dealing with topics that we are passionate about, we all migrate toward results and outcomes that confirm our biases, even when faced with objective, measurable, repeatable results that may not agree.
In environmental regulation, the road to green is not always a federal highway.

Elvis is still dead, there are no green space aliens hidden in Roswell NM, there was no JFK "miracle bullet," etc. Likewise, fracking does NOT cause earthquakes. You 'Henny-Pennys" just gotta have a conspiracy, don't you?

How anyone can think that evermore fossil fuels is ok when greenhouse gas concentrations are already close to 500ppm, is beyond me - especially when we are now seeing the impacts that were predicted over 100 years ago using relatively simple high school level physics, and we know it will get much worse. Gez, we don't need more scientists on this issue in Texas and other states (particularly in DC), we need friggin shrinks.

Nonsense; the only "impacts" we're seeing are caused by nature! The highest concentration of a so-called 'greenhouse' gas by far is harmless WATER VAPOR. Before attributing 'climate change' to fossil fuels, consider that one major volcanic eruption spewed more of those gasses into the atmosphere than the combined total of all combustion engines ever built. Until you can plug them, stop massive emissions from forests, oceans, etc, you would merely inconveniencing mankind. So-called 'alternative energy' sources are highly unreliable - especially when needed most. Replacing conventional and nuclear generators with wind, solar, etc, will GUARANTEE widespread and frequent BLACKOUTS. Think a little harder. Rather than scientific fact, you've bought into another, ever-changing political myth.

Incidentally, today I heard that the 'climate change group' was considering a switch BACK to global COOLING. Hillarious; they were pushing man-made cooling, an imminent ice age, back in the 1980s!
