DID YOU KNOW? LIGHT POLLUTION WASTES ENERGY & MONEY!

In the U.S. alone, there are about 100 million street and commercial outdoor light fixtures including:

- 40 million streetlights
- 60 million parking lot lights
- 60 million lights in commercial buildings

Residential outdoor lighting isn't as bright, but there's a lot more of it -- about 1 billion light fixtures.

Lighting Consumes Lots of Energy

In an average year in the U.S., outdoor lighting uses some 150 terawatt-hours of energy, mostly to illuminate streets and parking lots. That's enough energy to heat New York City's total electricity needs for 2 years!

Excessive light at night causes light pollution and unnecessary greenhouse gas emissions, contributing to climate change.

Let's Stop Wasting Light

DID YOU KNOW? ARTIFICIAL LIGHT AT NIGHT CAN HARM YOUR HEALTH

Humans evolved with the rhythms of the natural light-dark cycle of the day. To artificial light, most of us no longer experience truly dark nights.

Circadian Rhythms and Melatonin

Like most life forms, humans have a natural rhythm to their lives. This rhythm is controlled by the body's internal clock, which is influenced by the natural light-dark cycle of the day.

Exposure to artificial light at night disrupts the body's internal clock, which can lead to health problems such as sleep disorders, depression, and even cancer.

Blue-rich light at night is particularly disruptive to the body's internal clock. It is found in many artificial light sources, including computer screens, TVs, and other electronic devices.
