## Asteroid Dust Found In Crater Closes Case Of Dinosaur Extinction

© UNIVERSITY OF TEXAS AT AUSTIN (HTTPS://WWW.TRENDRADARS.COM/US/AUTHOR/UNIVERSITY-OF-TEXAS-AT-AUSTIN/) © MAY 1, 2022 4 MIN READ

READ FULL ARTICLE ON DB: 来源 (http://astrobiology.com/2021/02/asteroid-dust-found-in-crater-closes-case-of-dinosaur-extinction.html)

The crater left by the asteroid that wiped out the dinosaurs is located in the Yucatán Peninsula and is called Chicxulub after a nearby town. Part of the crater is offshore and part of it is on land. The crater is buried beneath many layers of rock and sediment. A 2016 mission led by the International Ocean Discovery Program extracted rock cores from the offshore portion of the crater. CREDIT The University of Texas at Austin/Jackson School of Geosciences/ Google Maps

Researchers believe they have closed the case of what killed the dinosaurs, definitively linking their extinction with an asteroid that slammed into Earth 66 million years ago by finding a key piece of evidence: asteroid dust inside the impact crater.

Death by asteroid rather than by a series of volcanic eruptions or some other global calamity has been the leading hypothesis since the 1980s, when scientists found asteroid dust in the geologic layer that marks the extinction of

the dinosaurs. This discovery painted an apocalyptic picture of dust from the vaporized asteroid and rocks from impact circling the planet, blocking out the sun and bringing about mass death through a dark, sustained global winter – all before drifting back to Earth to form the layer enriched in asteroid material that’s visible today.

In the 1990s, the connection was strengthened with the discovery of a 125-mile-wide Chicxulub impact crater beneath the Gulf of Mexico that is the same age as the rock layer. The new study seals the deal, researchers said, by finding asteroid dust with a matching chemical fingerprint within that crater at the precise geological location that marks the time of the extinction.

“The circle is now finally complete,” said Steven Goderis, a geochemistry professor at the Vrije Universiteit Brussel, who led the study published in Science Advances on Feb. 24.

The study is the latest to come from a 2016 International Ocean Discovery Program mission co-led by The University of Texas at Austin that collected nearly 3,000 feet of rock core from the crater buried under the seafloor. Research from this mission has helped fill in gaps about the impact, the aftermath and the recovery of life.

The telltale sign of asteroid dust is the element iridium – which is rare in the Earth’s crust, but present at elevated levels in certain types of asteroids. An iridium spike in the geologic layer found all over the world is how the asteroid hypothesis was born. In the new study, researchers found a similar spike in a section of rock pulled from the crater. In the crater, the sediment layer deposited in the days to years after the strike is so thick that scientists were able to precisely date the dust to a mere two decades after impact.

“We are now at the level of coincidence that geologically doesn’t happen without causation,” said co-author Sean Gulick, a research professor at the UT Jackson School of Geosciences who co-led the 2016 expedition with Joanna Morgan of Imperial College London. “It puts to bed any doubts that the iridium anomaly [in the geologic layer] is not related to the Chicxulub crater.”

The dust is all that remains of the 7-mile-wide asteroid that slammed into the planet millions of years ago, triggering the extinction of 75% of life on Earth, including all nonavian dinosaurs.

Researchers estimate that the dust kicked up by the impact circulated in the atmosphere for no more than a couple of decades – which, Gulick points out, helps time how long extinction took.

“If you’re actually going to put a clock on extinction 66 million years ago, you could easily make an argument that it all happened within a couple of decades, which is basically how long it takes for everything to starve to death,” he said.

The highest concentrations of iridium were found within a 5-centimeter section of the rock core retrieved from the top of the crater’s peak ring – a high-elevation point in the crater that formed when rocks rebounded then collapsed from the force of impact.

The iridium analysis was carried out by labs in Austria, Belgium, Japan and the United States.

“We combined the results from four independent laboratories around the world to make sure we got this right,” said Goderis.

In addition to iridium, the crater section showed elevated levels of other elements associated with asteroid material. The concentration and composition of these “asteroid elements” resembled measurements taken from the geologic layer at 52 sites around the world.

The core section and geologic layer also have earthbound elements in common, including sulfurous compounds. A 2019 study found that sulfur-bearing rocks are missing from much of the rest of the core despite being present in large volumes in the surrounding limestone. This indicates that the impact blew the original sulfur into the atmosphere, where it may have made a bad situation worse by exacerbating global cooling and seeding acid rain.

Gulick and colleagues at the University of Texas Institute for Geophysics and Bureau of Economic Geology – both units of the UT Jackson School – plan to return to the crater this summer to begin surveying sites at its center, where they hope to plan a future drilling effort to recover more asteroid material.

(<https://www.trendradars.com/latest/article-53151-asteroids-like-the-one-that-killed-the-dinosaurs-may-be-more-common-than-thought-study/>)  
Researchers set out to investigate the processes that lead to asteroid impacts like the deadly Chicxulub impact event 66 million years ago.

**Estimating heat wave frequency and strength: A Chicago case study**  
(<https://www.trendradars.com/latest/article-26356-estimating-heat-wave-frequency-and-strength-a-chicago-case-study/>)  
Urbanization and human-caused climate changes have led to increases in heat events around the world. For example, in July 2012, an extreme heat wave hit the Chicago area, causing temperatures to skyrocket to 40 degrees Celsius (104 degrees Fahrenheit) and above. Chicago, like most cities, is affected by urban heat islands (UHIs), which occur when changes in land cover create spaces that are warmer than their surrounding area. Satellite measurements can be used to inform models to characterize the intensity of UHIs, yet satellite techniques have some limitations—expensive sensors and low temporal resolution, among other drawbacks. But quantifying the intensity of UHIs could help public health officials and city planners learn to mitigate the impacts of future heat waves.

**Two extremes at the same time: Precipitation trends determine how often droughts and heat waves will occur together**  
(<https://www.trendradars.com/latest/article-25819-two-extremes-at-the-same-time-precipitation-trends-determine-how-often-droughts-and-heat-waves-will-occur-together/>)  
Prolonged droughts and heat waves have negative consequences both for people and the environment. If both of these extreme events occur at the same time, the impacts, in the form of wild fires, tree mortality or crop losses—to name a few examples—can be even more severe. Climate researchers at the Helmholtz Centre for Environmental Research (UFZ) have now discovered that, assuming a global temperature increase of two degrees in the course of global warming, the future frequency of these simultaneously occurring extreme events is primarily determined by local precipitation trends. Understanding this is important, since it enables us to improve our risk adaptation to climate change and our assessment of its consequences, as they write in the journal Nature Climate Change.

After selling out Day 1 in less than 2 hours, those who missed out on the pandemonium was hoping that a Day 2 concert would be announced. After some teasing over the last couple of days, it's now official... Yuvan himself confirmed today that he is ready to party

For fans of Australian wine, Penfolds likely needs no introduction. Penfolds has been at the forefront of the Australian wine

COMMERCE CITY, Colo. — Nashville ended the Colorado Rapids' team record 23-game home unbeaten streak, winning 3-1 Saturday night behind two goals from Hany Mukhtar. Colorado had not lost a Major League Soccer regular-season home game since a 3-1 home regular-season unbeaten...

Singapore is in the midst of preparations for visitors return, Malaysians included, with a fresh new look. Singapore has recorded more than 540,000 visitors from around the world, 45,560 from Malaysia, between January to April this year, making Malaysia the 3rd I now. With the borders reopened, the numbers [...]
