ABSTRACT

This 2003 Spring Semi-Annual Report contains a summary of the Final Technical Report being prepared for the Soil Remediation Requirements at Commercial and Centralized Drilling-Fluid Disposal (CCDD) Sites project funded by the United States Department of Energy under DOE Award No. DE-AC26-99BC15225. The summary describes (1) the objectives of the investigation, (2) a rationale and methodology of the investigation, (3) sources of data, assessment of data quality, and data availability, (4) examples of well documented centralized and commercial drilling-fluid disposal (CCDD) sites and other sites where drilling fluid was disposed of, and (5) examples of abandoned sites and measures undertaken for their assessment and remediation. The report also includes most of the figures, tables, and appendices that will be included in the final report.

Tables

1. Data availability for drilling-fluid disposal sites in Louisiana, New Mexico, Oklahoma, and Texas.

2. Numbers of sites in database that performed chemical analyses
3. Comparisons between authorized sites with abandoned sites for site-average concentrations of constituents of concern in pit sludge and groundwater.
4. Standards and guidelines from various regulatory agencies that have been used to assess environmental conditions associated with E&P waste sites.

INTRODUCTION

A portion of oil and gas exploration and production (E&P) drilling fluids has been disposed of at Commercial and Centralized Drilling-fluid Disposal (CCDD) sites. Commercial facilities accept drilling fluid and other waste allowed by their disposal permit from any operator on a fee basis. Centralized facilities receive spent drilling fluid from several leases held by an operator or from several sites on the same lease. Centralized facilities are noncommercial sites with no commingling of waste from other operators. During the past few decades, the amount of spent drilling fluids sent offsite for disposal at CCDD sites has decreased from about 28 to 2 percent on a nationwide basis (American Petroleum Institute, 2000).

Drilling fluids used in oil and gas exploration and production (E&P) operations may be mixed with drilling additives, cuttings, formation water and crude oil. Although current regulations address the operation and closure of present-day drilling-fluid disposal sites, many older sites were operated under less comprehensive and, perhaps, less attentive regulation. Sites may have received wastes other than spent drilling fluids and may have been abandoned without proper closure. Prediction of constituent identities and concentrations at abandoned facilities is difficult because few compilations and summaries are available. Closure of abandoned CCDD sites in Louisiana, New Mexico, Oklahoma, and Texas is the jurisdiction of State regulatory agencies: Louisiana Department of Natural Resources Office of Conservation (LOC); New Mexico Energy, Mineral, and Natural Resources Department Oil Conservation Division (NMEMNRD); Oklahoma Corporation Commission (OCC); and Railroad Commission of Texas (TRRC).

This study is a census, compilation, and summary of information on currently active, inactive, and abandoned CCDD sites in these four States. It also includes data from a few sites that received spent drilling-fluid in addition to their primary operations. Information was collected from State-agency files to (1) develop and evaluate a multi-state information data base of credible technical data, (2) provide a basis for making State-funded site assessment and remediation more cost effective, and (3) participate in technology transfer workshops to document how this data base can be used for improving regulation, assessment, and remediation. Because data on abandoned sites is sparse, we also examined permitted sites that are currently operating (active) or have been closed (inactive) under State regulation. We tested the hypothesis that data from well-documented active or recently active sites could be used to predict conditions that at poorly documented abandoned sites.

CCDD sites in the four states included in the study differ both because of State regulation and industry practice as well as local and regional environmental conditions. New Mexico, for example, discourages off-site disposal of drilling waste. Off-site commercial disposal, however, permitted under special conditions, for example, where sensitive environments would be otherwise impacted. Louisiana and Oklahoma allow no centralized pits and no commingling of drilling waste on a noncommercial basis. Texas allows on-site, centralized, and commercial disposal of spent drilling fluid.

RESULTS AND DISCUSSION

Census Results

Data were collected and tabulated for 286 CCDD sites (fig. 1; table 1) from the LOC, NMEMNRD, OC, and TRRC. Data (appendix A) included: (1) names and locations of sites; (2) number of pits or land-treatment cells per site (fig. 2); (3) size of disposal pits or land-treatment cells per site (fig. 3); (4) chemical analyses of pit or cell sludge, pit water, sump water (land treatment), and groundwater sampled at monitoring wells (table 2, fig. 4, appendix B); and (5) groundwater elevations. Each data type was not available for every site. The sites in our database do not compose an exhaustive list of all currently and previously operating CCDD sites, but rather are sites for which data were available during the data collection phase of our investigation.

In our survey clay-lined earthen pits were found to be the most common repositories for drilling wastes. Treatment cells from 12 CCDD land-treatment facilities were also examined (table 1, appendix A) because they provided additional data on E&P waste composition and on-site groundwater characteristics. A few sites that were permitted as salt-water disposal or oil-reclamation facilities were also included where drilling fluid waste was identified on the site. There also are some data where drilling fluids had been discharged at an unauthorized site.

Comparison of Cited Analytical Methods

Standard laboratory procedures (USEPA, 1983, 1986, ALPHA-AWWA-WPCF, 1985) were found referenced in data reports, although many data reports contained no reference to analytical method. Reports that did not specify analytical methodologies

might have applied standard procedures. We assumed that data from different sites can be compared regardless of analytical method.

Constituents of Concern

The multi-state database provides information about the composition and distribution of constituents that can be mapped. Most State files do not contain mapped data, but mapping of monitoring data provides a useful picture to show how site conditions vary through time. Examples of mapped constituent concentrations in drilling-fluid waste are provided in figures 5 to 7. Examples of mapped constituent concentrations in groundwater are provided in figures 6 and 8 to 30. Data on water levels from site monitoring wells also were mapped as part of this analysis. Examples of how water level can vary across a site are given in figures 6, 8 to 10, 14 to 18, 28 to 30, 36. Comparison of well documented active and inactive CCDD sites versus poorly documented abandoned sites shows that maximum average concentration of constituents are generally consistent. Constituent concentrations at abandoned sites generally are within the range for constituents at active and inactive sites. At some abandoned sites, maximum average concentration of barium, chromium, lead, silver, TPH, or BTEX, of constituents is greater than at active and inactive CCDD sites that we reviewed (table 3). We conclude that data from well-documented sites may be used to predict conditions at abandoned sites except that older abandoned sites might have outlier concentrations for these metals and organics. The differences may reflect a change in industry practice. Also, we obtained data on soil contamination outside of disposal areas or treatment cells only for two sites (figs. 31 and 36); findings, therefore, apply only to on-site conditions.

Spent drilling-fluids are classified as non-hazardous wastes and are exempt from RCRA regulations. However, States included in our study have different requirements for permitting, operation, and closure of drilling-fluid disposal sites (table 4). No Texas regulations pertain specifically to CCDD sites. Differences in regulatory requirements and in industry practices result in variations in the abundances of data for CCDD sites in State agency files. The OCC has abundant data on groundwater for many sites because the OCC requires that several on-site monitoring wells be installed at each site. Louisiana currently has monitoring wells installed around all land treatment sites and has an abundance of monitoring data for historical disposal-pit sites. Texas has no general requirement for monitoring of sites, so the most abundant data are from detailed assessment of specific sites.

We compared average constituent concentrations calculated for sites in the database with various State and EPA standards and guidelines (table 4). Groundwater at a significant number of sites had chloride average concentrations (greater than 250 mg/L) that exceeded unenforceable aesthetic EPA secondary drinking water standards (SMCL), or TDS concentrations (greater than 10,000 mg/L) that exceeded EPA standards for underground drinking water sources (USDW) (USEPA, 2000).

There have been a number of recent or ongoing investigations at abandoned sites by the States (appendix A): 9 in Louisiana (figs. 9, 14), 10 in Oklahoma (figs. 5, 23), and 11 in Texas (figs. 6, 28 to 36). We identified no records of abandoned CCDD sites in New Mexico. A list of abandoned CCDD sites in Louisiana with the status of assessment and remediation activities was provided by the LOC. TRRC maintains a list of oil and-gas E&P sites in Texas that are or have been under investigation was provided by the TRRC;

but it did not distinguish CCDD from other types of sites. The count of abandoned CCDD sites in Oklahoma and Texas was compiled from information in agency files.

Summary of Assessment Techniques

Agency files also contain information on practices for site assessment for abandoned CCDD sites. Data from Oklahoma and Texas indicate that techniques used for site-assessment ranged from visual inspections to comprehensive geotechnical and scientific surveys. Survey measurements have included geophysical measurements; sampling and analyses of chemical composition of wastes, soil, groundwater, and surface water; measurement of water levels in monitoring wells; soil-gas measurement; radon detection; well tests of hydraulic conductivity; elevation surveys; and coring and description of core. Louisiana has assessed and closed one abandoned CCDD site, is assessing one abandoned CCDD site, is developing plans to assess six sites, is in the process of remediating one abandoned CCDD site, and is developing plans to remediate three abandoned CCDD sites. Most assessments of abandoned CCDD sites in Oklahoma consisted of stratigraphic surveys and chemical analyses of solid wastes; historical data for surface water and groundwater were available for several sites. TRRC conducted comprehensive assessments at some sites with stratigraphic surveys, chemical analyses of wastes, surface water, and groundwater, and geophysical measurements. Such in-depth assessments are expensive, however, and may not be cost-effective for all sites. At other Texas sites, assessments included inspection, mapping, and chemical analyses of soils, wastes, and groundwater.

Summary of Remediation Techniques Applied at CCDD Sites

Site remediation measures had been undertaken for one Louisiana CCDD site and three abandoned CCDD- and other sites in Texas (figs 30, 35, and 36) as of data collection phase of this study. Remediation techniques were recommended on the basis of site assessments. Remediation alternatives discussed for seven Texas CCDD sites addressed (1) a physical hazard related to waste pits having low load-bearing strength and (2) potential for groundwater transport of dissolved salt and petroleum hydrocarbons that might be leached from wastes. Recommended options included excavation of wastes and contaminated adjacent soils followed by either (1) removal to permitted disposal facilities, or (2) land farming (land spreading or land treatment) if sufficient on-site area were available. In one case on-site burial and capping with impervious materials were recommended. Groundwater remediation was not found to be necessary at any abandoned CCDD site in Texas as of December 2002. Installation of additional monitoring wells and continued monitoring of on-site groundwater were generally recommended; further monitoring may indicate a need for remediation. Assessments are continuing for most abandoned CCDD sites in our investigation and final determinations for remediation measures are pending.

CONCLUSIONS

We found records for 286 CCDD sites in Louisiana, New Mexico, Oklahoma, and Texas. Of these, 55 were active and 197 were inactive as of January 2002, and 34 had been abandoned. Most (95 percent) were disposal-pit facilities and the rest were used for land treatment of drilling fluids. The typical disposal-pit facilities has fewer than 3

disposal cells on site. The median size of a facility's pits is approximately 2 acres. The sites in our database do not compose an exhaustive list of all currently and previously operating CCDD sites, but rather are sites for which data were available during the data collection phase of our investigation.

Frequency graphs for typically measured constituents of concern at CCDD sites, including chloride and TPH in groundwater and in pit water, BTEX in pit water, and chloride, TPH, BTEX, barium, and arsenic in sludge, provide a statistical reference for evaluating the mean value of a constituent of concern at an individual site. Standard laboratory procedures are being used in the four states so data comparability is high, although we could not find specific analytical references for many reports. Groundwater at a significant number of sites had average chloride concentration greater than 250 mg/L, the unenforceable aesthetic EPA secondary drinking water standards (SMCL), or TDS concentration greater than 10,000 mg/L, the EPA standards for underground drinking water sources.

Groundwater at a significant number of sites had chloride average concentrations (greater than 250 mg/L) that exceeded unenforceable aesthetic EPA secondary drinking water standards (SMCL), or TDS concentrations (greater than 10,000 mg/L) that exceeded EPA standards for underground drinking water sources (USDW) (USEPA, 2000).

Techniques used for site-assessment range from visual inspections to comprehensive geotechnical and scientific surveys with geophysical measurements; sampling and analyses of chemical composition of wastes, soil, groundwater, and surface water; measurement of water levels in monitoring wells; soil-gas measurement; radon detection;

well tests of hydraulic conductivity; elevation surveys; and coring and description of core. Such in-depth assessments are expensive, however, and may not be cost-effective for all sites. Screening criteria that semi-quantitatively prioritize sites for detailed assessment are used.

Recommendations for remediation typically are developed as part of site assessment. Remediation alternatives for CCDD sites include excavation of wastes and contaminated adjacent soils followed by either removal to permitted disposal facilities, or land farming if sufficient on-site area were available. Groundwater remediation was not found to be necessary at any abandoned CCDD site in Texas as of December 2002. Assessments or monitoring are continuing for most abandoned CCDD sites in our investigation and final determinations for remediation measures are pending.

TECHNOLOGY TRANSFER

We presented a workshop on regulation, assessment, and remediation of oil field exploration and production sites, in Texas and Louisiana. The workshop was organized as a short course at the Annual Meeting of the Gulf Coast Association of Geological Societies in Austin, Texas. Presenters included Dr. Alan R. Dutton and Dr. Jeffrey G. Paine, Bureau of Economic Geology; Dr. Lloyd Deuel, Jr., Soil Analytical Services, Inc.; Mr. John Tintera, Railroad Commission of Texas; and Mr. Carroll Wascom, Louisiana Office of Conservation. The technology transfer workshop covered topics such as State regulation of CCDD sites in Texas and Louisiana, assessment techniques for CCDD sites, case histories of several CCDD sites, and considerations for selection of appropriate remediation methods.

A second technical paper was published presenting some of the results of this study. The paper by Nance and Dutton (2002) was published in the Transactions of the 52nd Annual Meeting of the Gulf Coast Association of Geological Societies. Approximately 50 people attended the technical presentation of the paper. The technical session at which the presentation was made was chaired by Mr. John Tintera (TRRC) and Mr. Carroll Wascom (LOC). The previous paper by Dutton and others (2000) was published in the Proceedings of the Ground Water Protection Council.

We constructed and continue to update a web area on the Bureau of Economic Geology web site (<http://www.beg.utexas.edu/research<<address>>>) wherein the public can review many of our findings. The Final Technical Report will be posted on the sight.

PLANS FOR NEXT REPORTING PERIOD

The remaining activity for the final reporting period through May 2003 is completion of the Final Technical Report. That report will integrate information from the previous semi-annual technical progress reports, the two published papers, and case histories from in-depth studies of CCDD sites in Texas.

ASSESSMENT OF PROSPECTS FOR FUTURE PROGRESS

We anticipate completing the Final Technical Report by the scheduled end of the contract in May 2003.

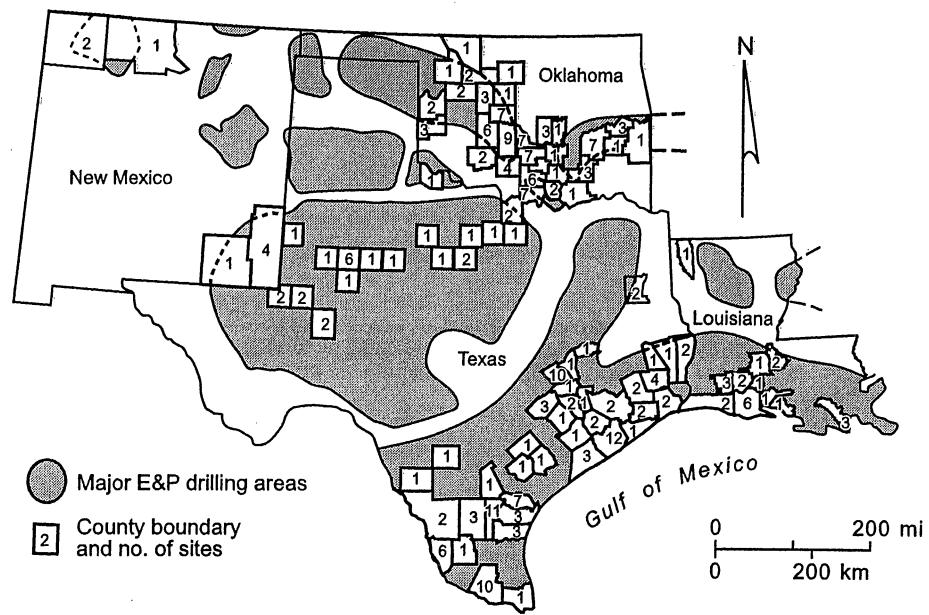

Figure 1. Commercial and centralized drilling-fluid disposal sites in the four-state study area, showing the number of inventoried CCDD sites located in each county or parish.

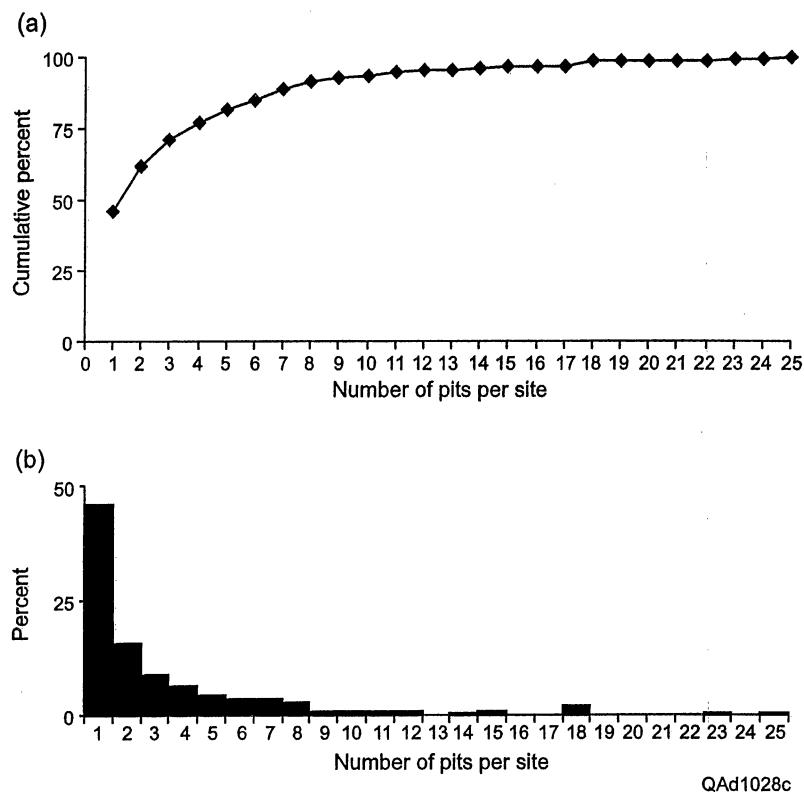

Figure 2. Cumulative (a) and frequency (b) graphs of numbers of pits per CCDD site in the database compiled to date.

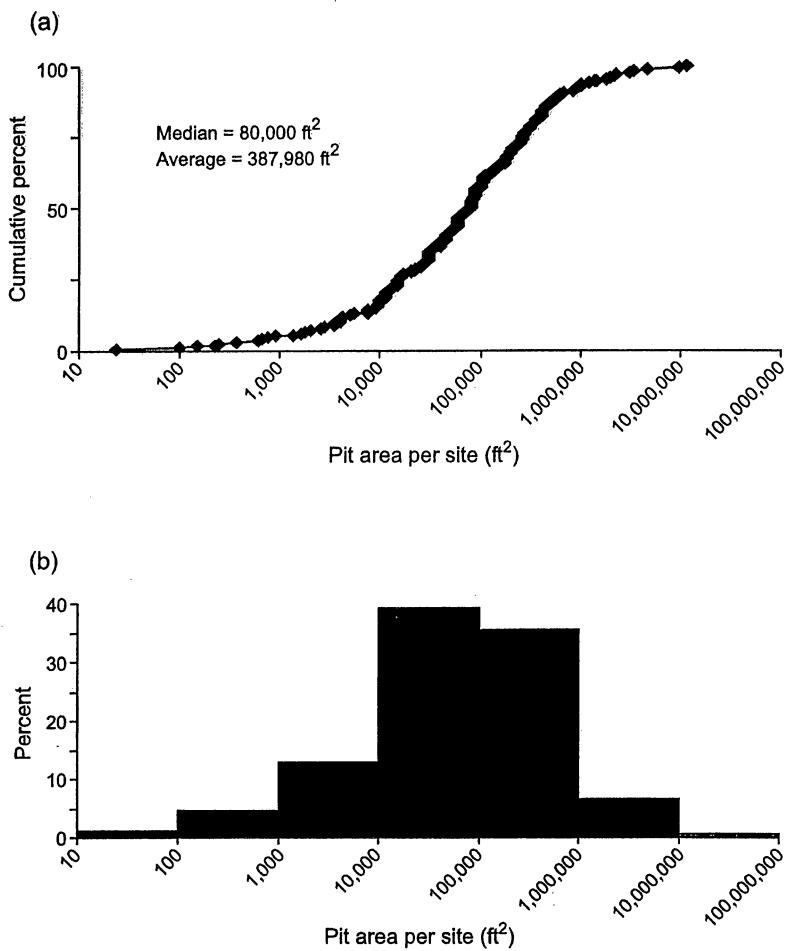

Figure 3. Cumulative (a) and frequency (b) graphs of areal coverage of pits per CCDD site in the database compiled to date.

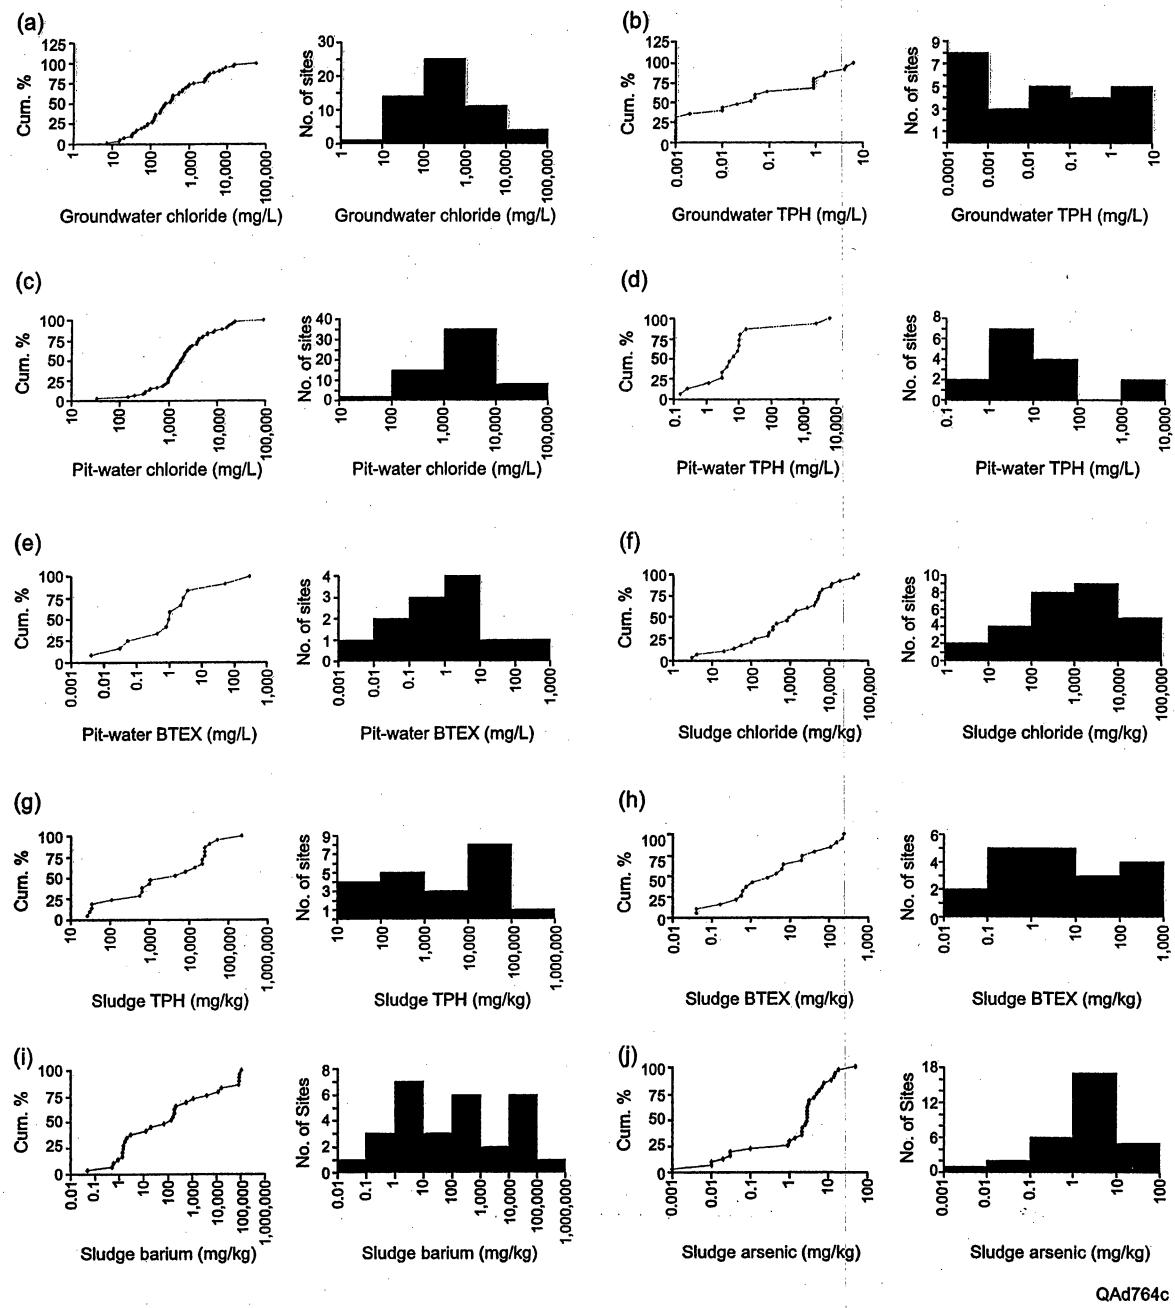

Figure 4. Cumulative and frequency graphs for selected constituents in groundwater and disposal pit contents: (a) chloride in groundwater, (b) TPH in groundwater, (c) chloride in pit water, (d) TPH in pit water, (e) BTEX in pit water, (f) chloride in sludge, (g) TPH in sludge, (h) BTEX in sludge, (i) arsenic in sludge, and (j) barium in sludge. Applicable plots are used (Figs. 5-30) as bases for comparison of individual sites with all sites in the database.

QAd764c

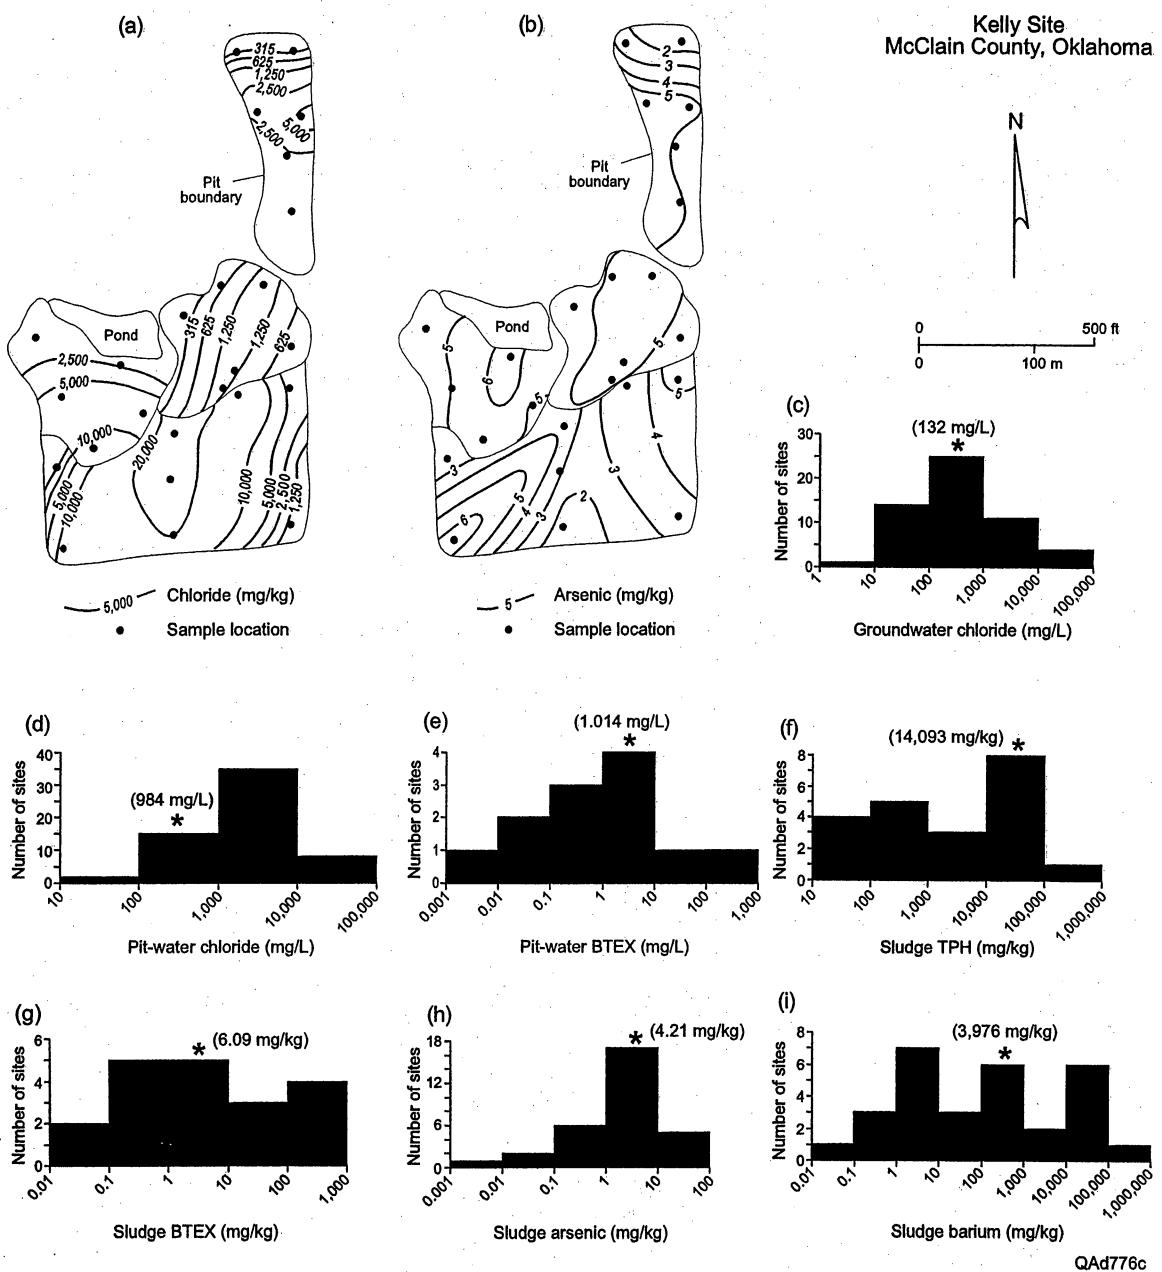

Figure 5. Kelly site, McClain County, Oklahoma: maps show (a) distribution of TPH in pit sludge, (b) Distribution of arsenic in pit sludge. Histograms show (c) mean chloride in groundwater, (d) mean chloride in pit water, (e) mean BTEX in pit water, (f) mean TPH in pit sludge, (g) mean BTEX in pit sludge, (h) mean arsenic in pit sludge, and (i) mean barium in pit sludge. Histograms in (c) to (i) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Kelly site. Mean concentration for site in parentheses.

QAd776c

Briggs Site
Matagorda County, Texas

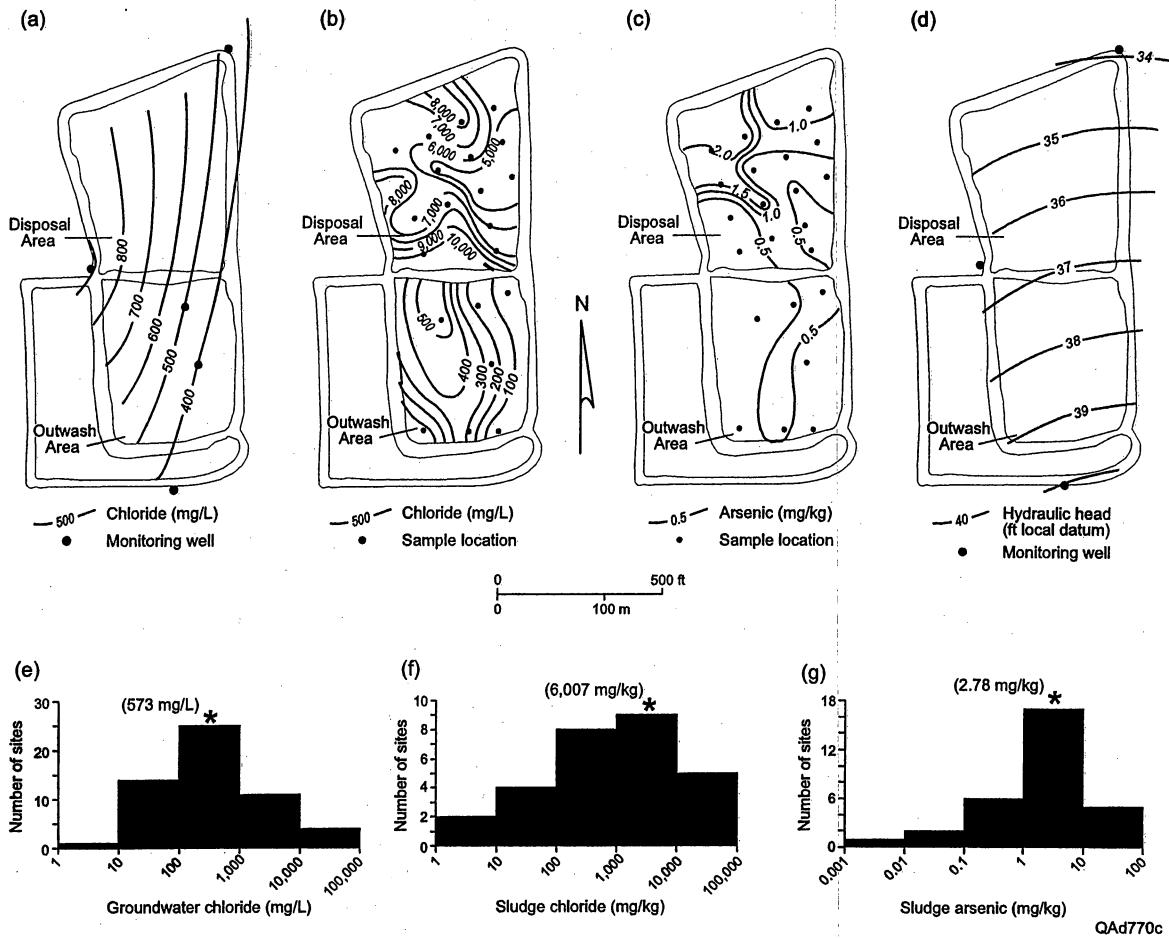

Figure 6. Vernon Briggs site, Matagorda County, Texas: maps show (a) distribution of chloride in groundwater, (b) distribution of chloride in pit sludge, (c) distribution of arsenic in pit sludge, and (d) water levels. Histograms show (e) mean chloride in groundwater, (f) mean chloride in pit sludge, and (g) mean arsenic in pit sludge. Histograms in (e) to (g) for all sites in the study sample (fig. 4). Star (*) indicates mean for Briggs site. Mean concentration for site in parentheses.

Post Oak Vacuum
Jasper County, Texas

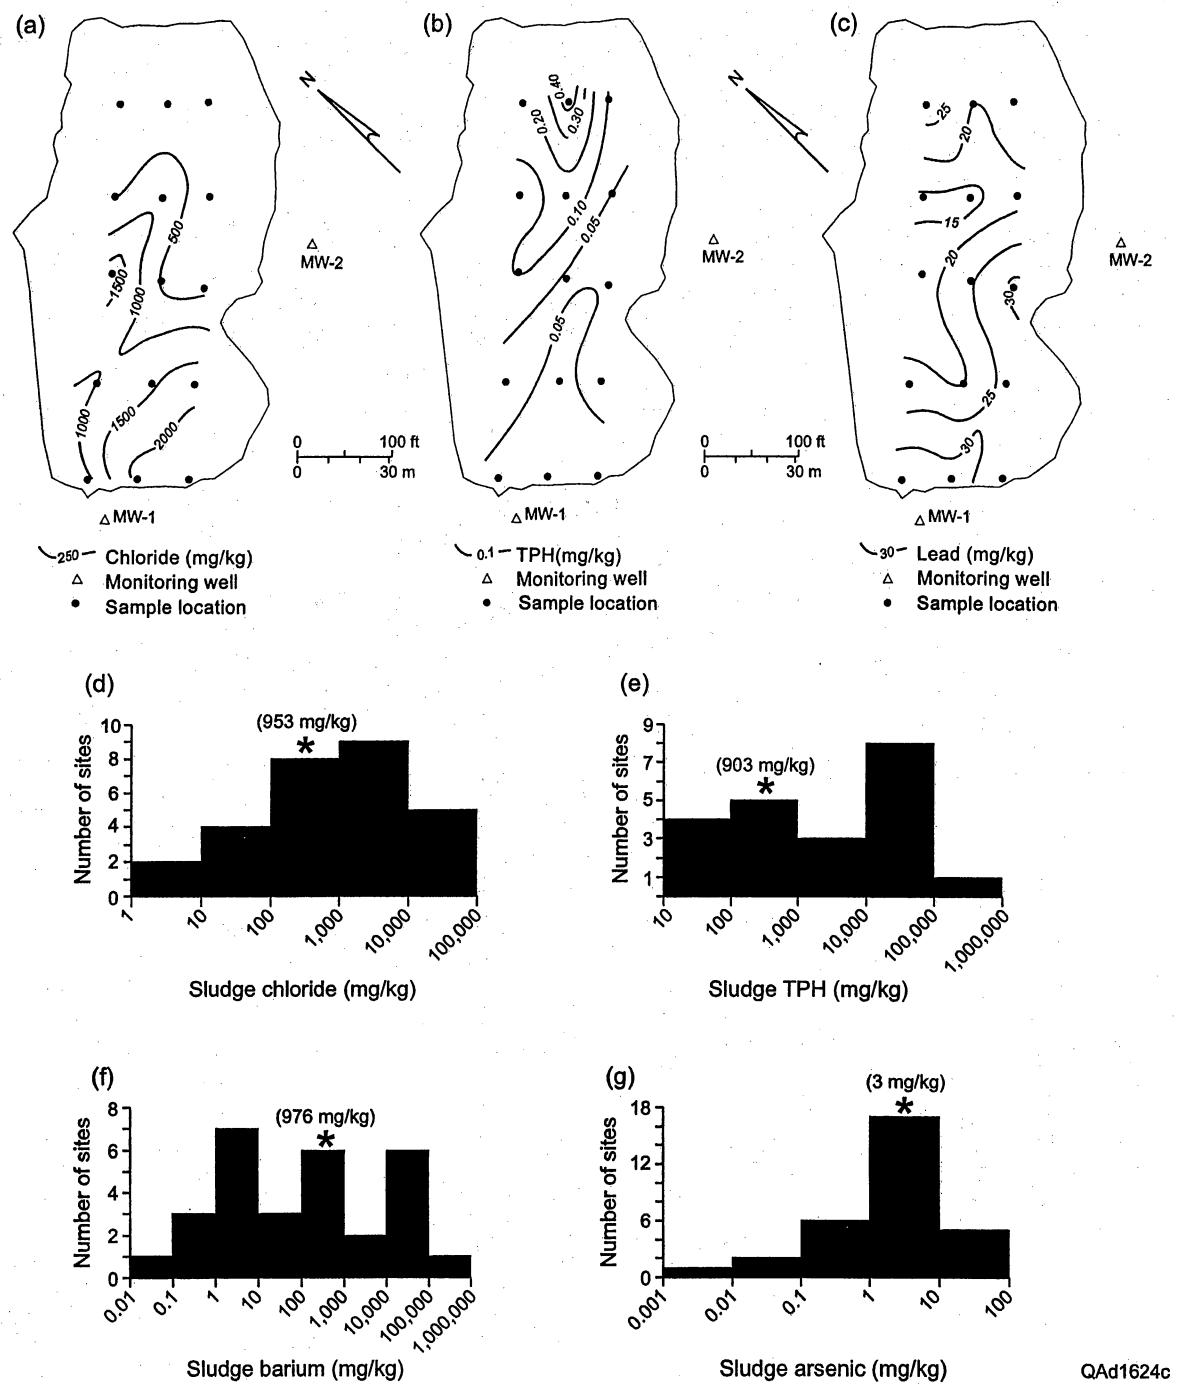

Figure 7. Post Oak site, Lee County, Texas: maps show (a) distribution of chloride in pit sludge, (b) distribution of TPH in pit sludge, and (c) distribution of lead in pit sludge. Histograms show (d) mean chloride in pit sludge, (e) mean TPH in pit sludge, (f) mean barium in pit sludge, and (g) mean arsenic in pit sludge. Histograms in (d) to (g) for all sites in the study sample. * mean for Post Oak site, mean concentration in parentheses.

Bateman Island Site
St. Mary's Parish, Louisiana

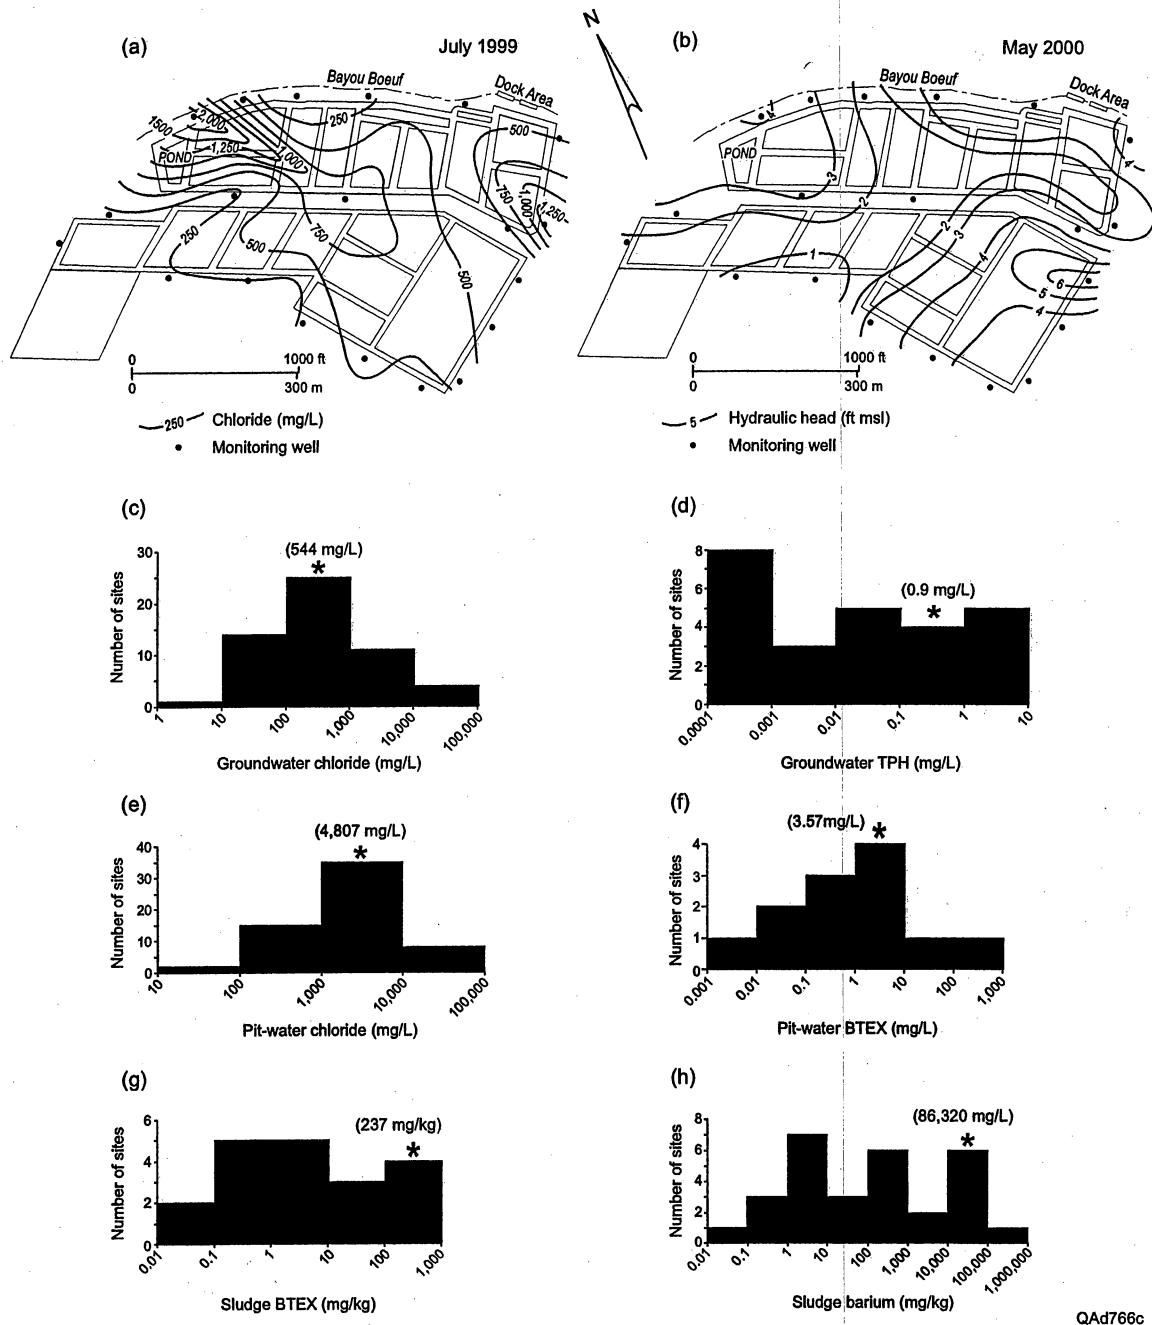

Figure 8. Bateman Island site, St. Mary's Parish, Louisiana: maps show (a) distribution of chloride in groundwater, and (b) water levels. Histograms show (c) mean chloride in groundwater, (d) mean total petroleum hydrocarbons in groundwater, (e) mean chloride in pit water, (f) mean BTEX in pit water, (g) mean BTEX in pit sludge, (h) mean barium in pit sludge. Histograms in (c) to (h) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Bateman Island site. Mean concentration for site in parentheses.

Big Diamond Site
Cameron Parish, Louisiana

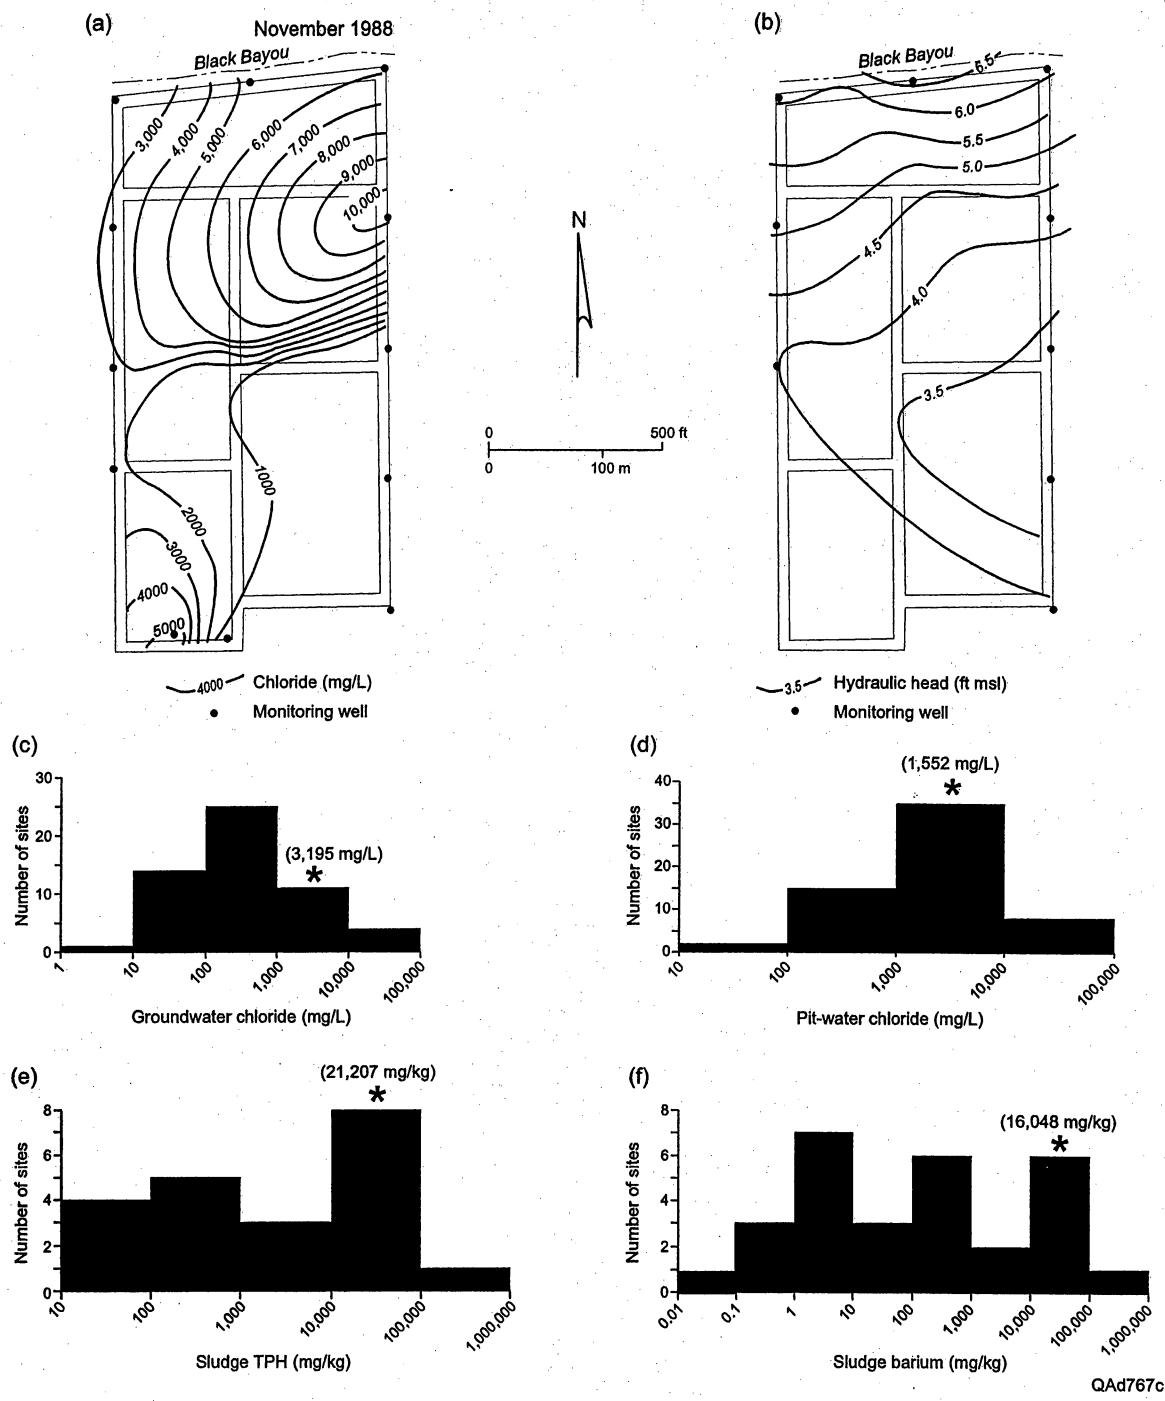

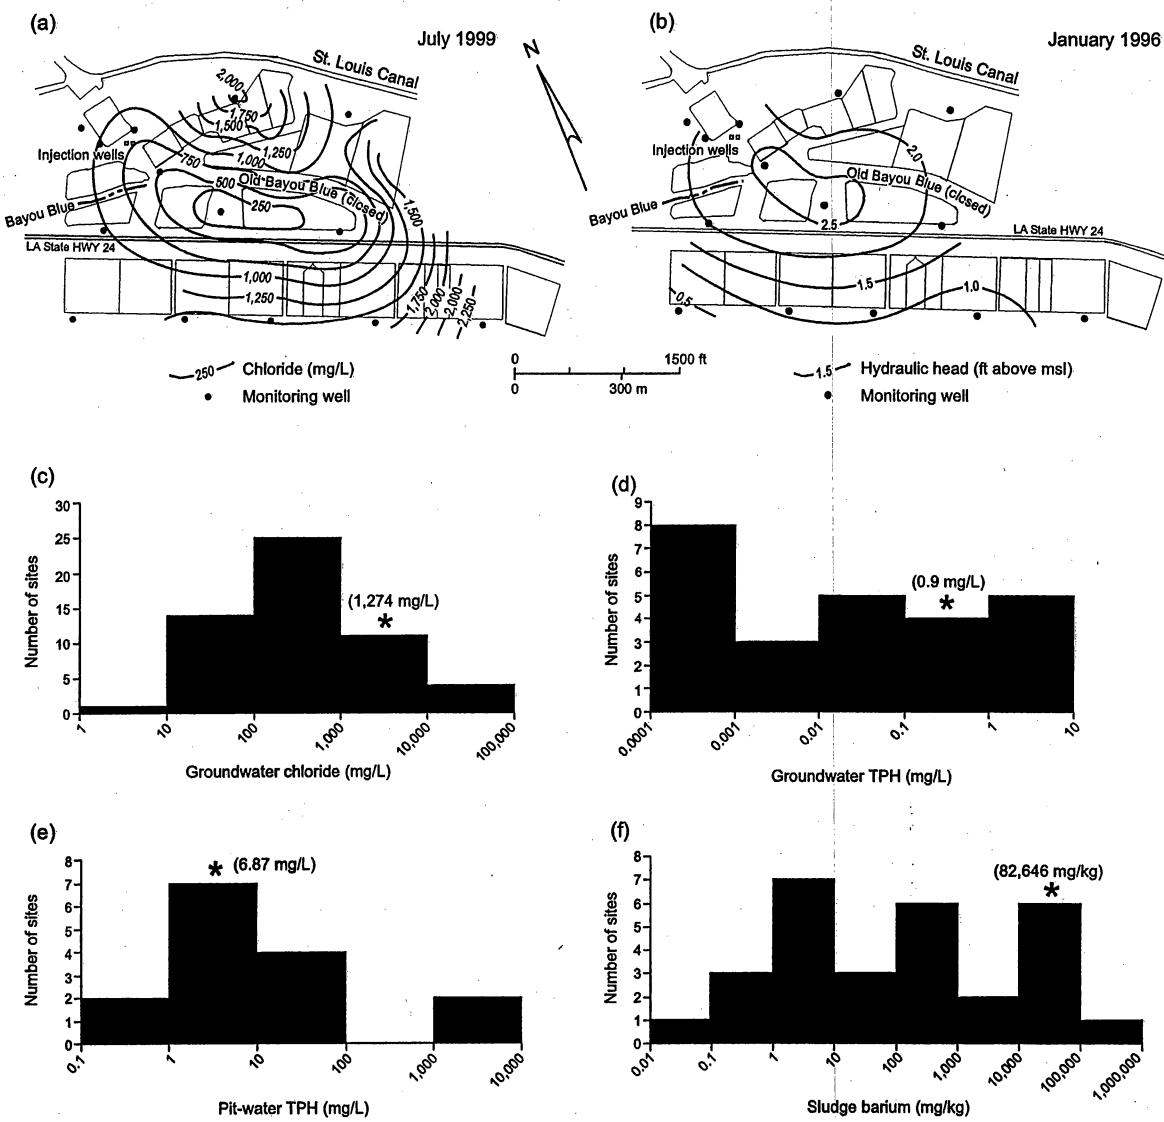

Figure 9. Big Diamond site, Cameron Parish, Louisiana: maps show (a) distribution of chloride in groundwater and (b) water levels. Histograms show (c) mean chloride in groundwater, (d) mean chloride in pit water, (e) mean TPH in pit sludge, (f) mean barium in pit sludge at CCDD sites. Histograms in (c) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Big Diamond site. Mean concentration for site in parentheses.

Bourg Site
Lafrouche Parish, Louisiana

QAd769c

Figure 10. Bourg site, Lafrouche Parish, Louisiana: maps show (a) distribution of chloride in groundwater, and (b) water levels. Histograms show (c) mean chloride in groundwater, (d) mean TPH in groundwater, (e) mean TPH in pit water, and (f) mean barium in pit sludge. Histograms in (c) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Bourg site. Mean concentration for site in parentheses.

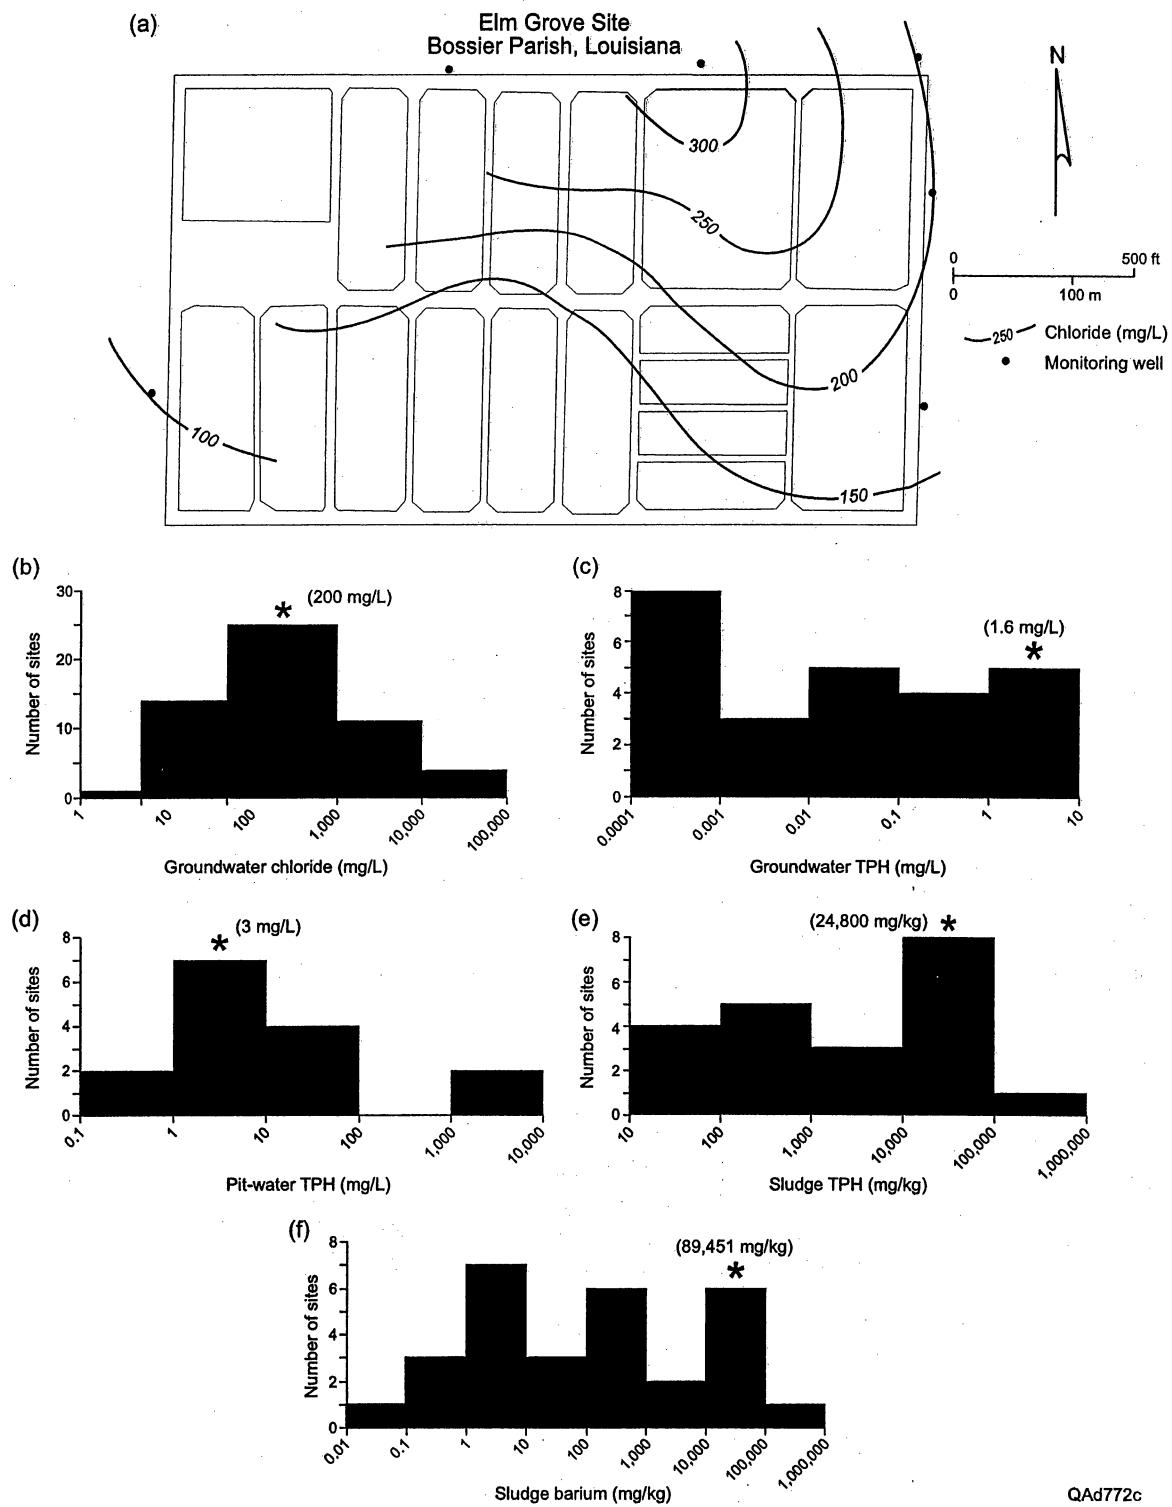

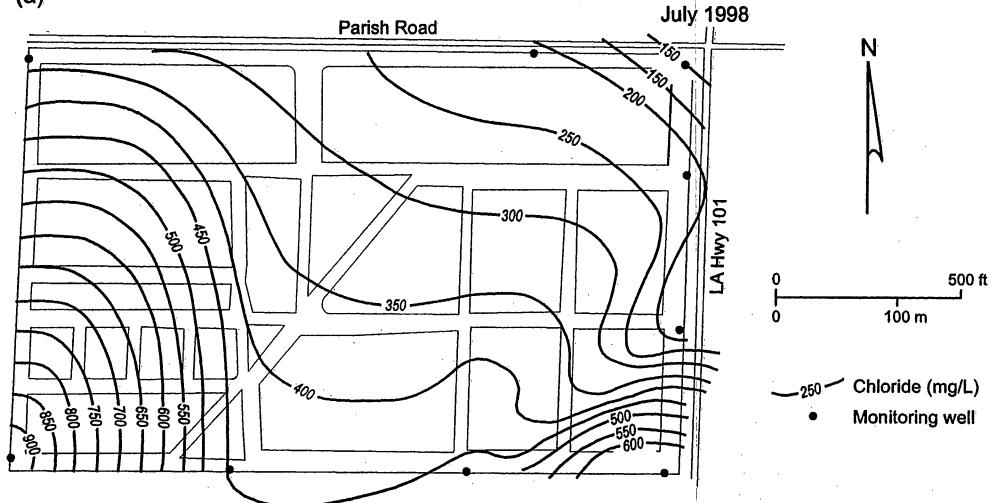

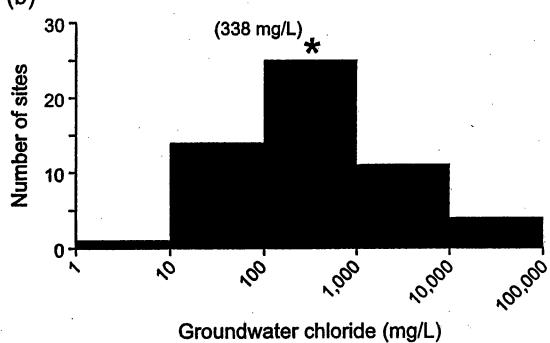

Figure 11. Elm Grove site, Bossier Parish, Louisiana: map shows (a) distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, (c) mean TPH in groundwater, (d) mean TPH in pit water, (e) mean TPH in pit sludge, and (f) mean barium in pit sludge. Histograms in (b) to (f) for all sites in the study sample (fig. 4). * mean for the Elm Grove site, mean concentration in parentheses.

Laccassine Site
Jefferson Davis Parish, Louisiana

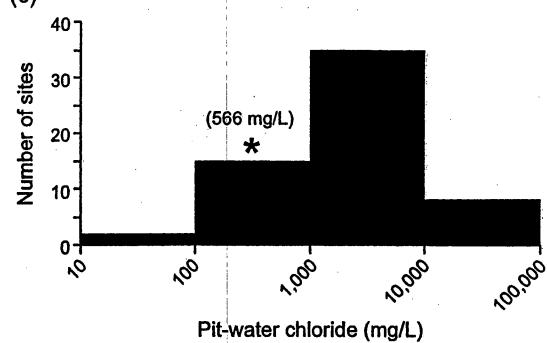

(a)

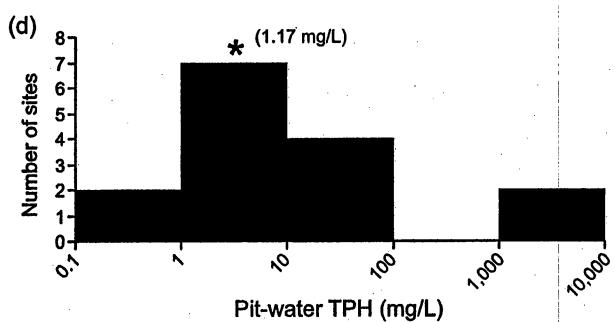

(b)

(c)

(d)

QAd777c

Figure 12. Laccassine site, Jefferson Davis Parish, Louisiana: map shows (a) distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, (c) mean chloride in pit water, and (d) mean TPH in pit water. Histograms in (b) to (d) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Laccassine site. Mean concentration for site in parentheses.

Lafourche Site
Lafourche Parish, Louisiana

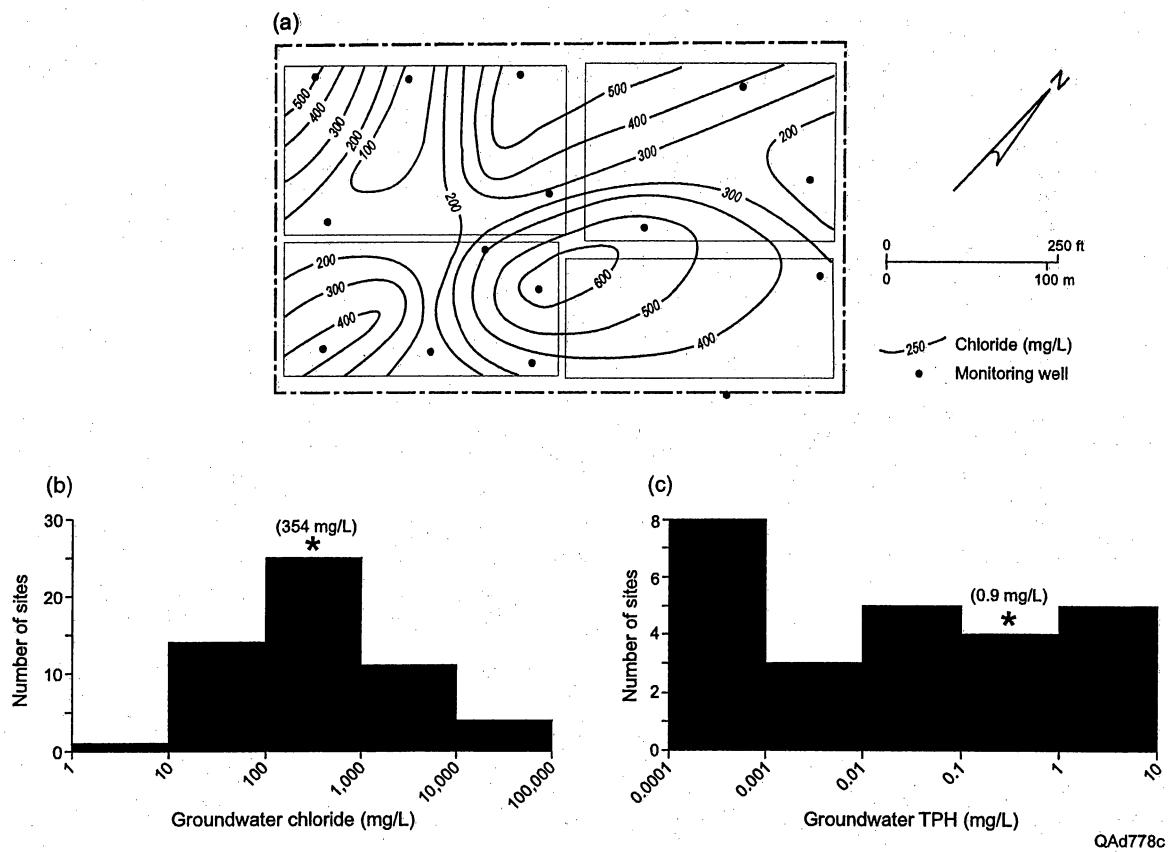

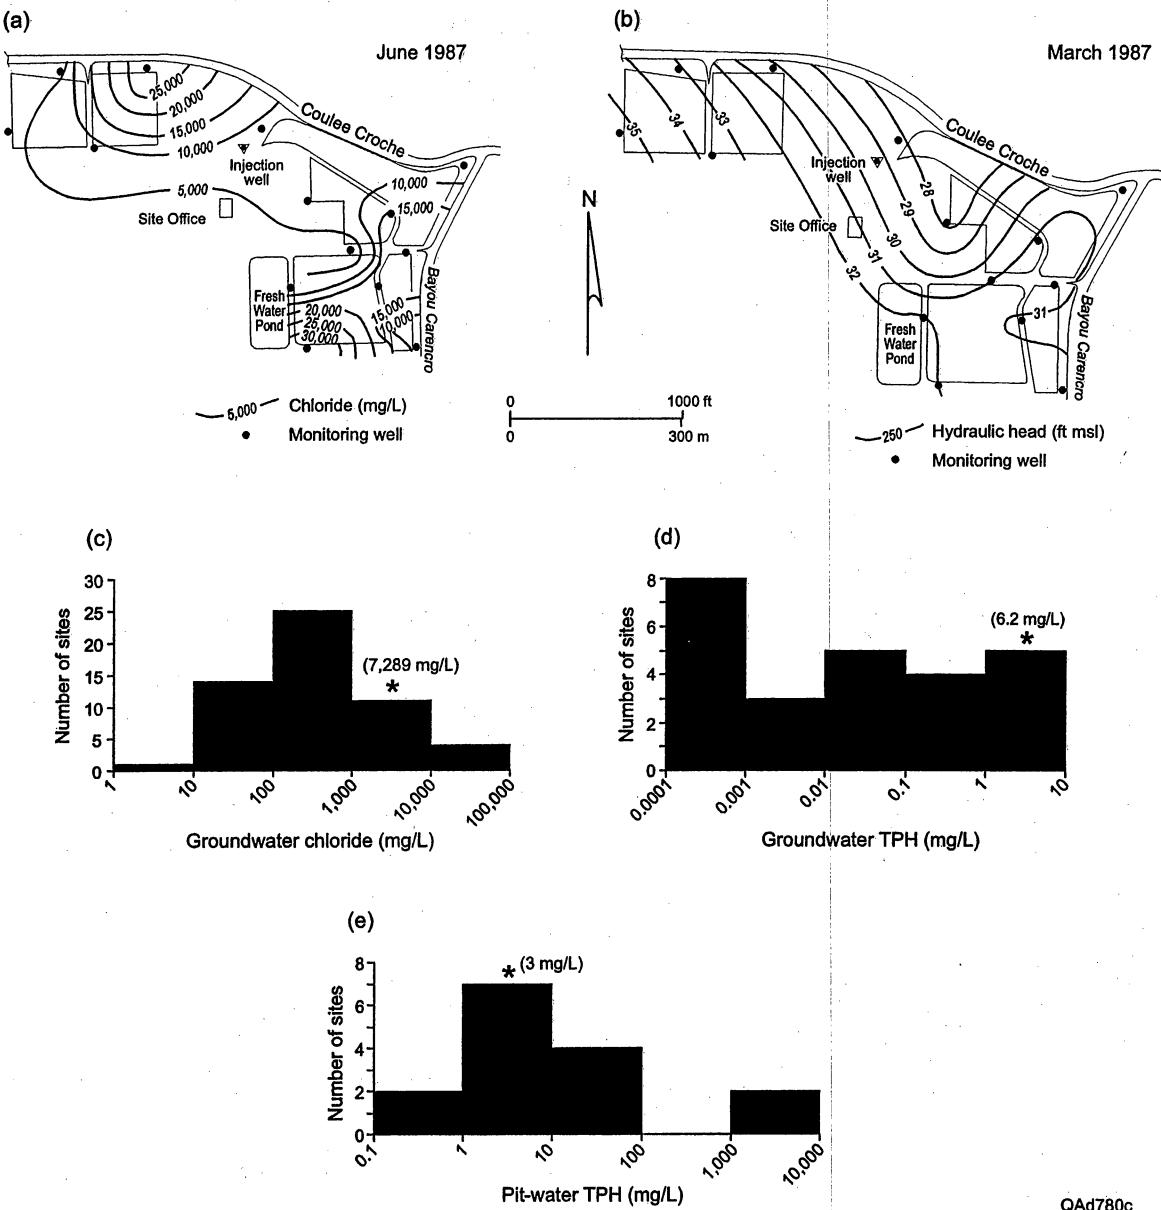

Figure 13. Lafrouche site, Lafrouche Parish, Louisiana: map shows (a) distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, and (c) mean TPH in groundwater. Histograms in (b) and (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Lafrouche site. Mean concentration for site in parentheses.

**MAR Site,
St. Landry Parish, Louisiana**

QAd780c

Figure 14. Mar site, St. Landry Parish, Louisiana: maps show (a) distribution of chloride in groundwater, and (b) water levels Histograms show (c) mean chloride in groundwater, (d) mean TPH in groundwater, and (e) mean TPH in pit water. Histograms in (c) to (e) for all sites in the study sample (fig. 4). Star (*) indicates mean for the MAR site. Mean concentration for site in parentheses.

Mermenau Site
Jefferson Davis Parish, Louisiana

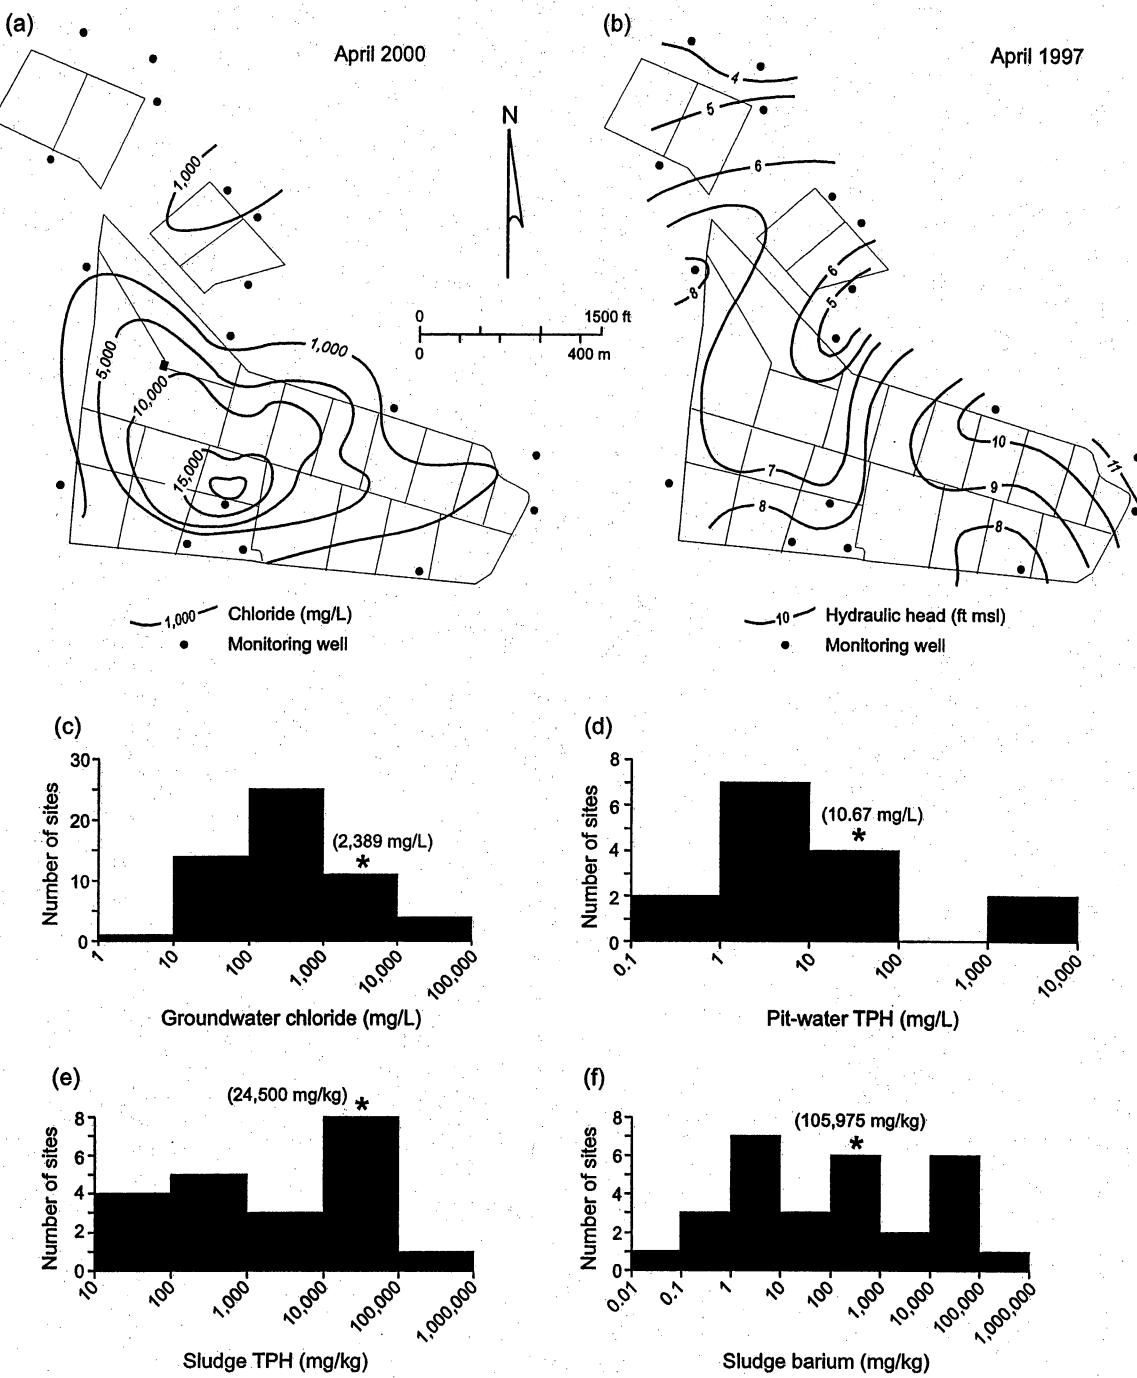

Figure 15. Mermenau site, Jefferson Davis Parish, Louisiana: maps show (a) distribution of chloride in groundwater, and (b) water levels. Histograms show (c) mean chloride in groundwater, (d) mean TPH in pit water, (e) mean TPH in pit sludge, and (f) mean barium in pit sludge. Histograms in (c) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Mermenau site. Mean concentration for site in parentheses.

QAd782c

Reliable Site
Pointe Coupee Parish, Louisiana

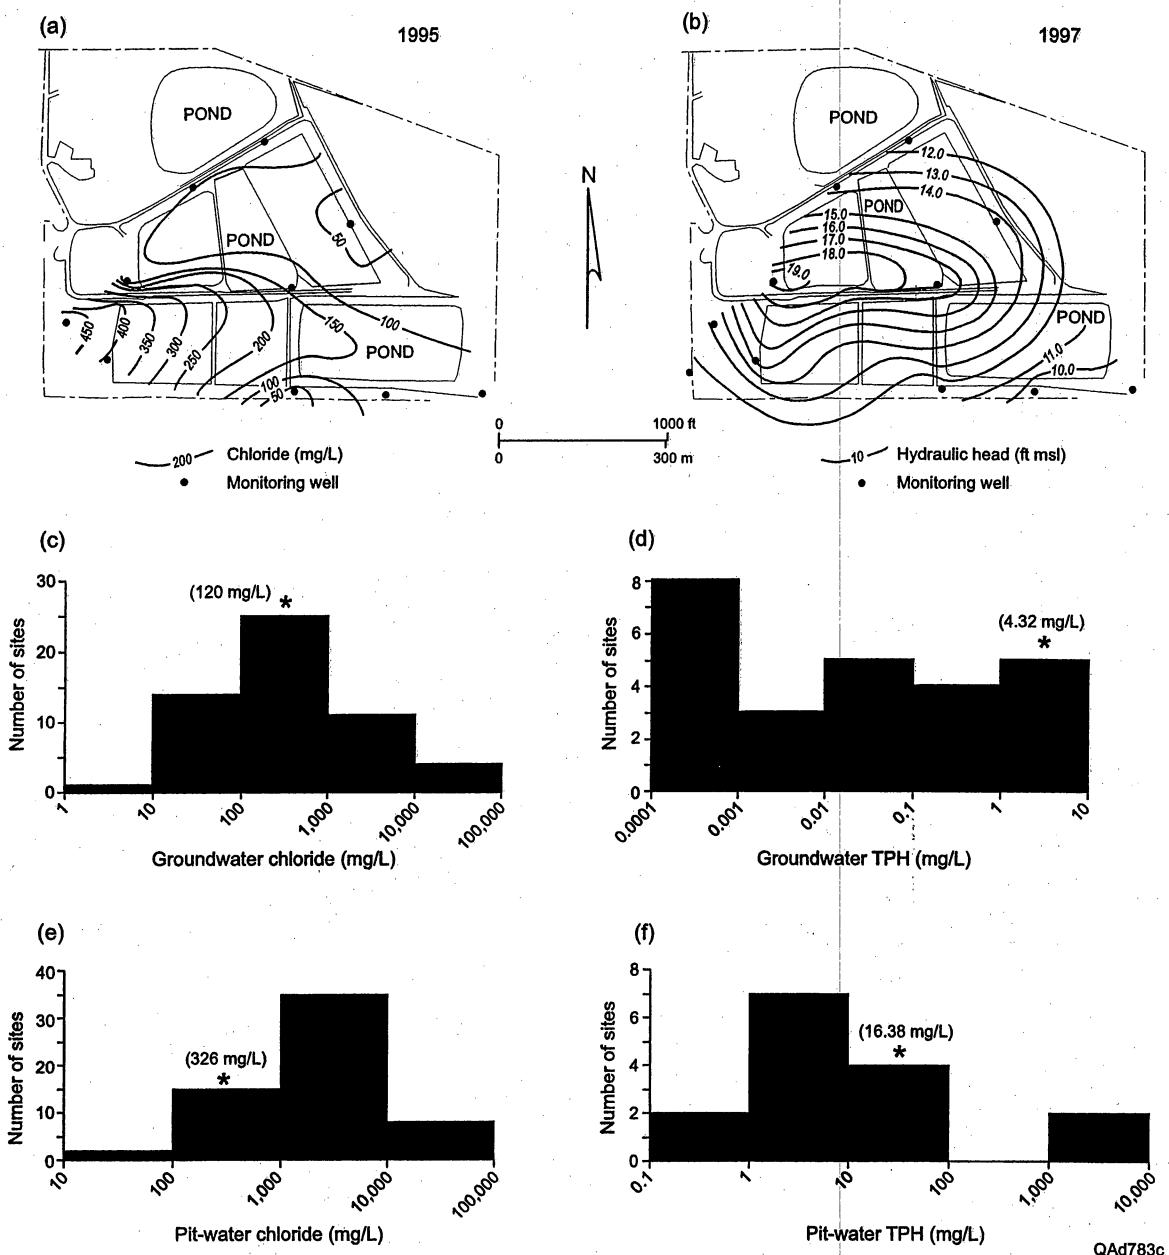

Figure 16. Reliable site, Pointe Coupee Parish, Louisiana: maps show (a) distribution of chloride in groundwater, and (b) water levels. Histograms show (c) mean chloride in groundwater, (d) mean TPH in groundwater, (e) mean chloride in pit water, and (f) mean TPH in pit water. Histograms in (c) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Reliable site. Mean concentration for site in parentheses.

Waguespack Site
Iberia Parish, Louisiana

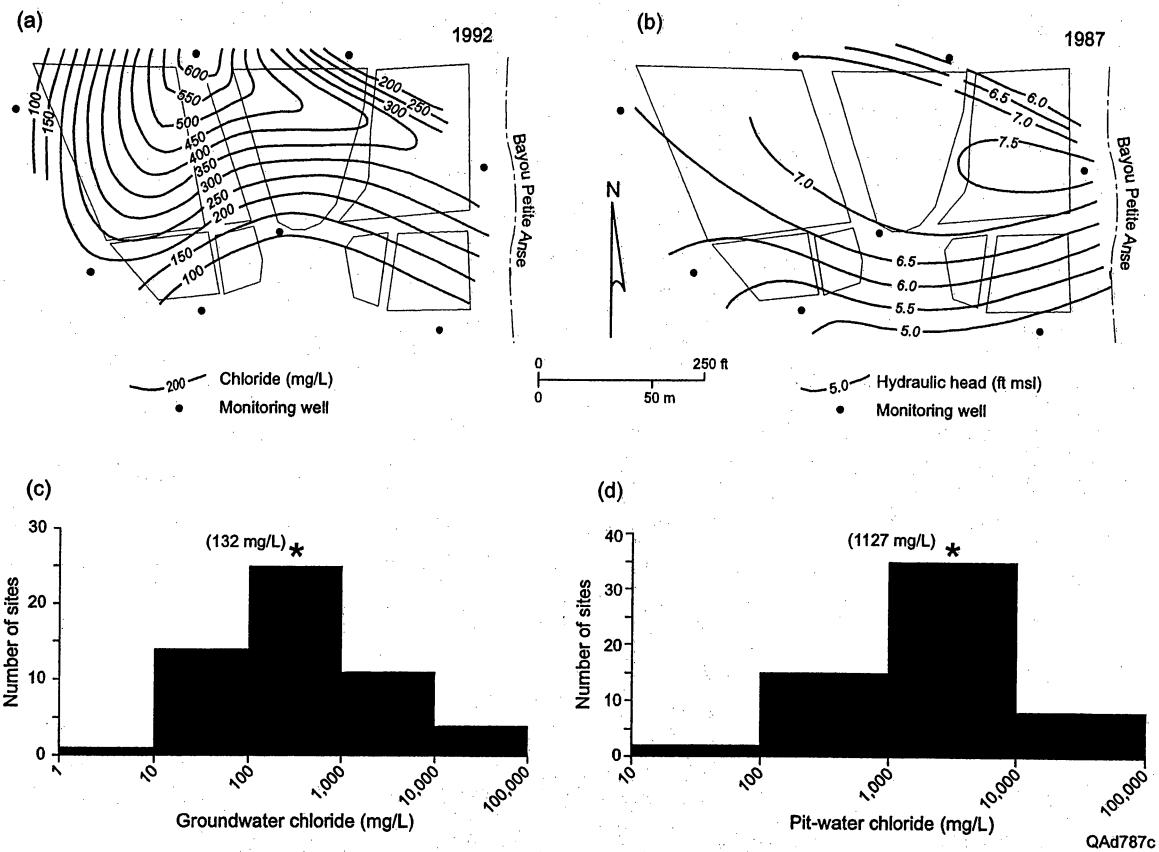

Figure 17. Waguespack site, Iberia Parish, Louisiana: maps show (a) distribution of chloride in groundwater, and (b) water levels. Histograms show (c) mean chloride in groundwater, and (d) mean chloride in pit water. Histograms in (c) and (d) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Waguespack site. Mean concentration for site in parentheses.

CRI Halfway Site
Lea County, New Mexico

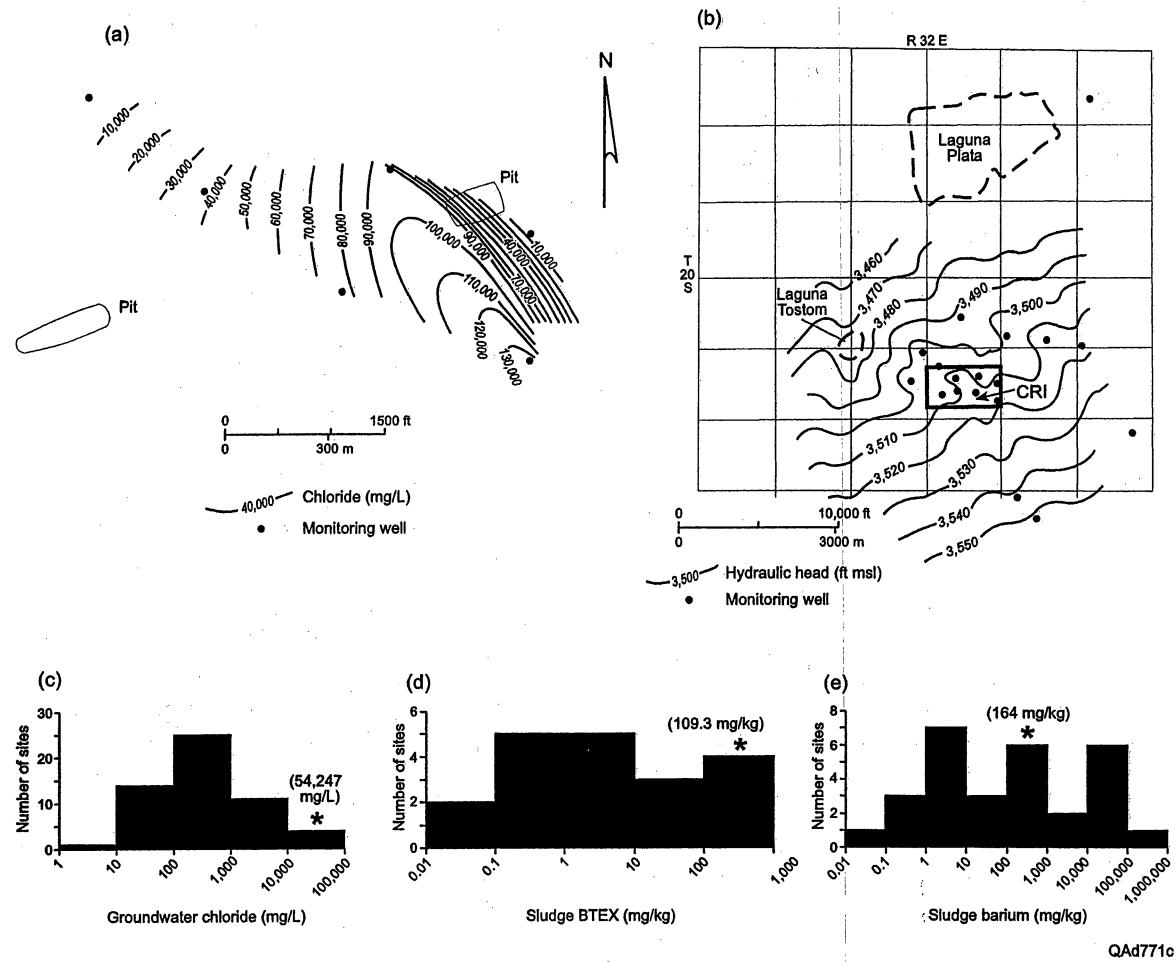

Figure 18. CRI Halfway site, Lea County, New Mexico: maps show (a) distribution of chloride in groundwater, and (b) water levels (map from agency files). Maps show (c) mean chloride in groundwater, (d) mean BTEX in pit sludge, and (e) mean barium in pit sludge. Histograms in (c) to (e) for all sites in the study sample (fig. 4). Star (*) indicates mean for the CRI Halfway site. Mean concentration for site in parentheses.

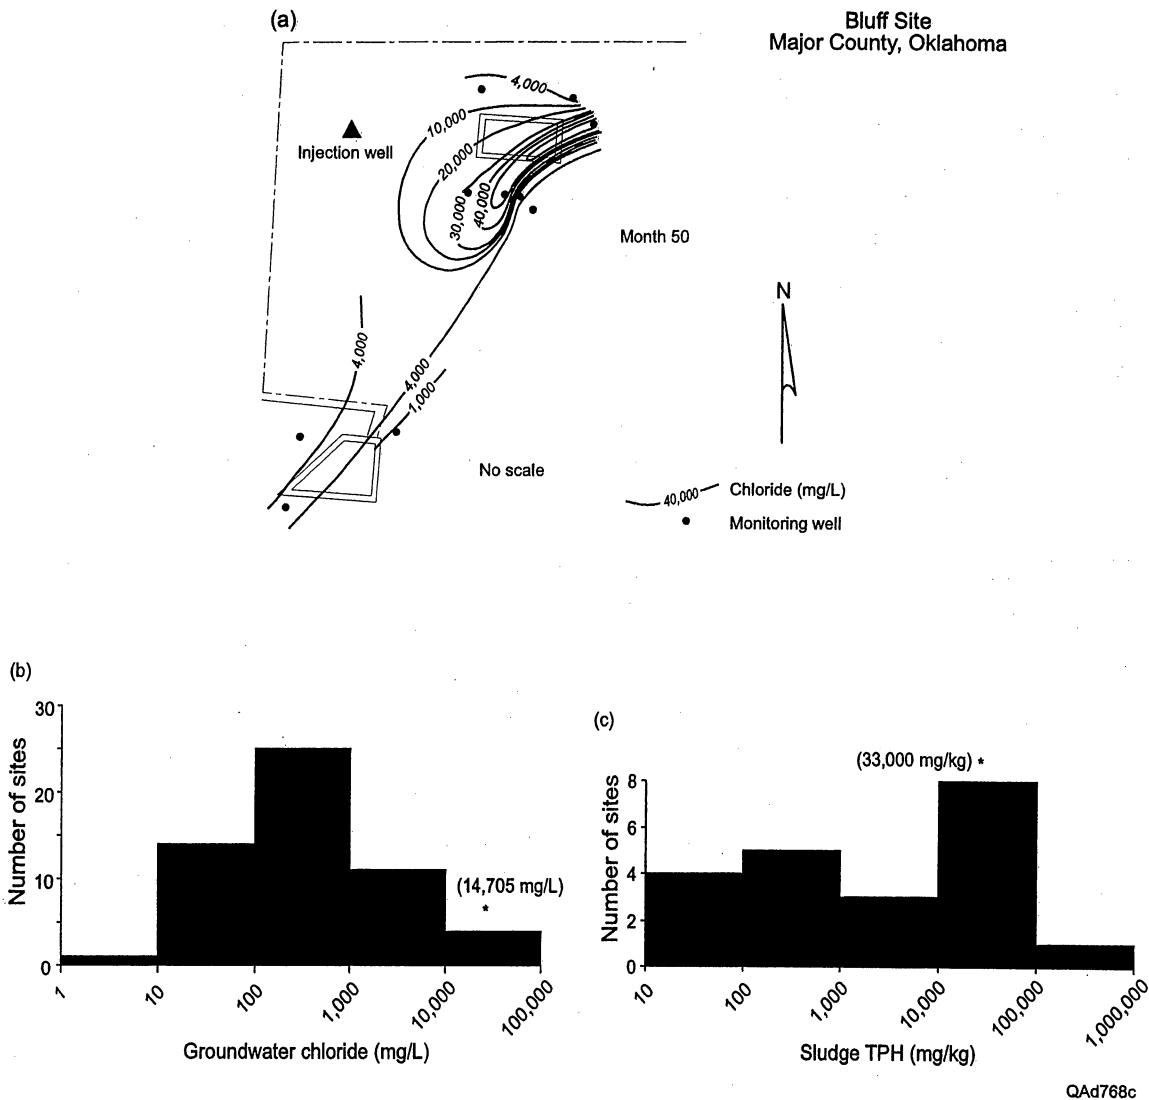

Figure 19. Bluff site, Major County, Oklahoma: (a) map shows distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, and (c) mean TPH in pit sludge at CCDD sites. Histograms in (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Bluff site. Mean concentration for site in parentheses.

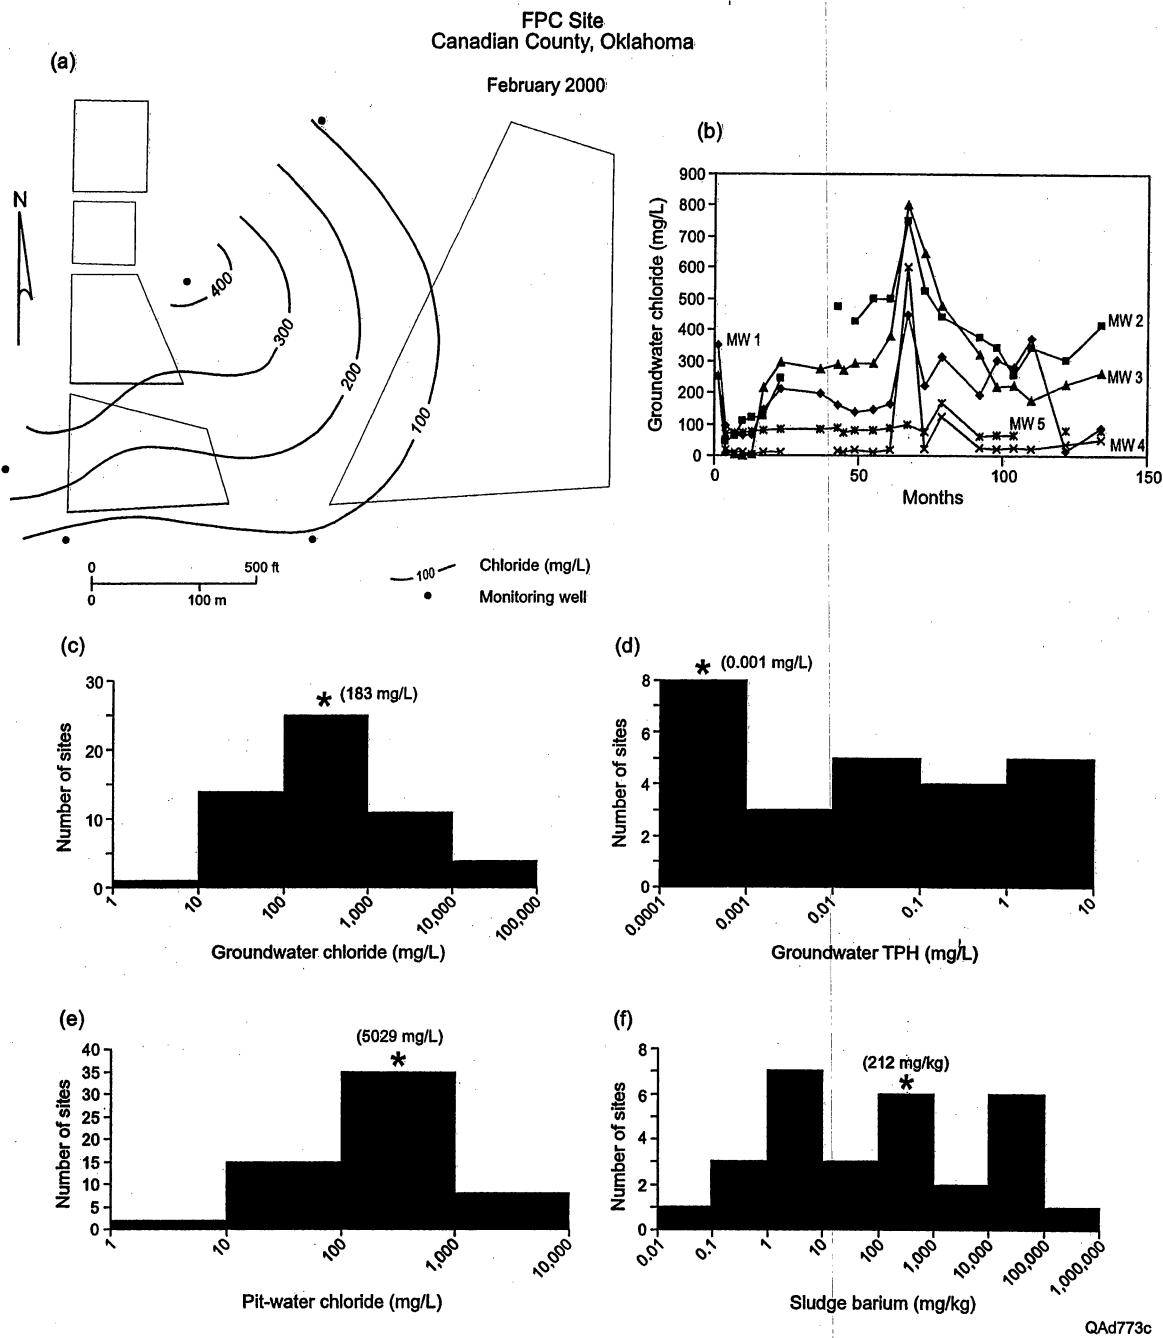

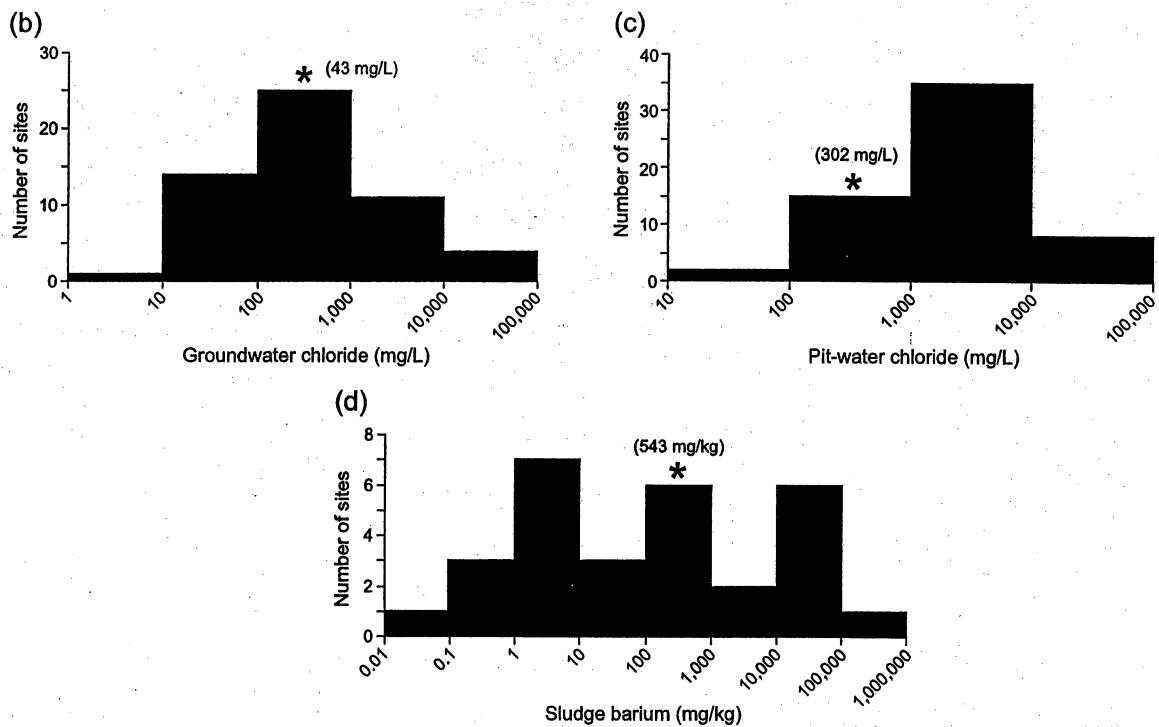

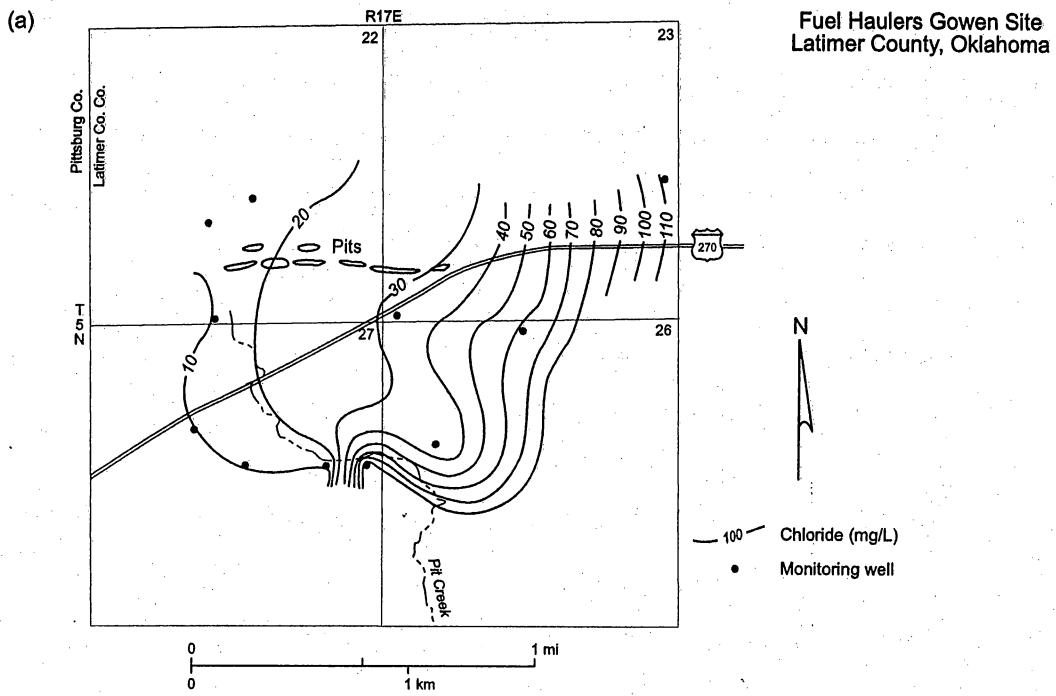

Figure 20. FPC site, Canadian County, Oklahoma: map shows (a) distribution of chloride in groundwater. (b) Time-series plot of chloride in groundwater by monitoring wells. Histograms show (c) mean chloride in groundwater, (d) mean TPH in groundwater, (e) mean chloride in pit water, and (f) mean barium in pit sludge. Histograms in (c) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for the FPC site. Mean concentration for site in parentheses.

QAd774c

Figure 21. Gowen site, Latimer County, Oklahoma: (a) map shows distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, (c) mean chloride in pit water, and (d) mean barium in pit sludge. Histograms in (b) to (d) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Gowen site. Mean concentration for site in parentheses.

Guard Site
Major County, Oklahoma

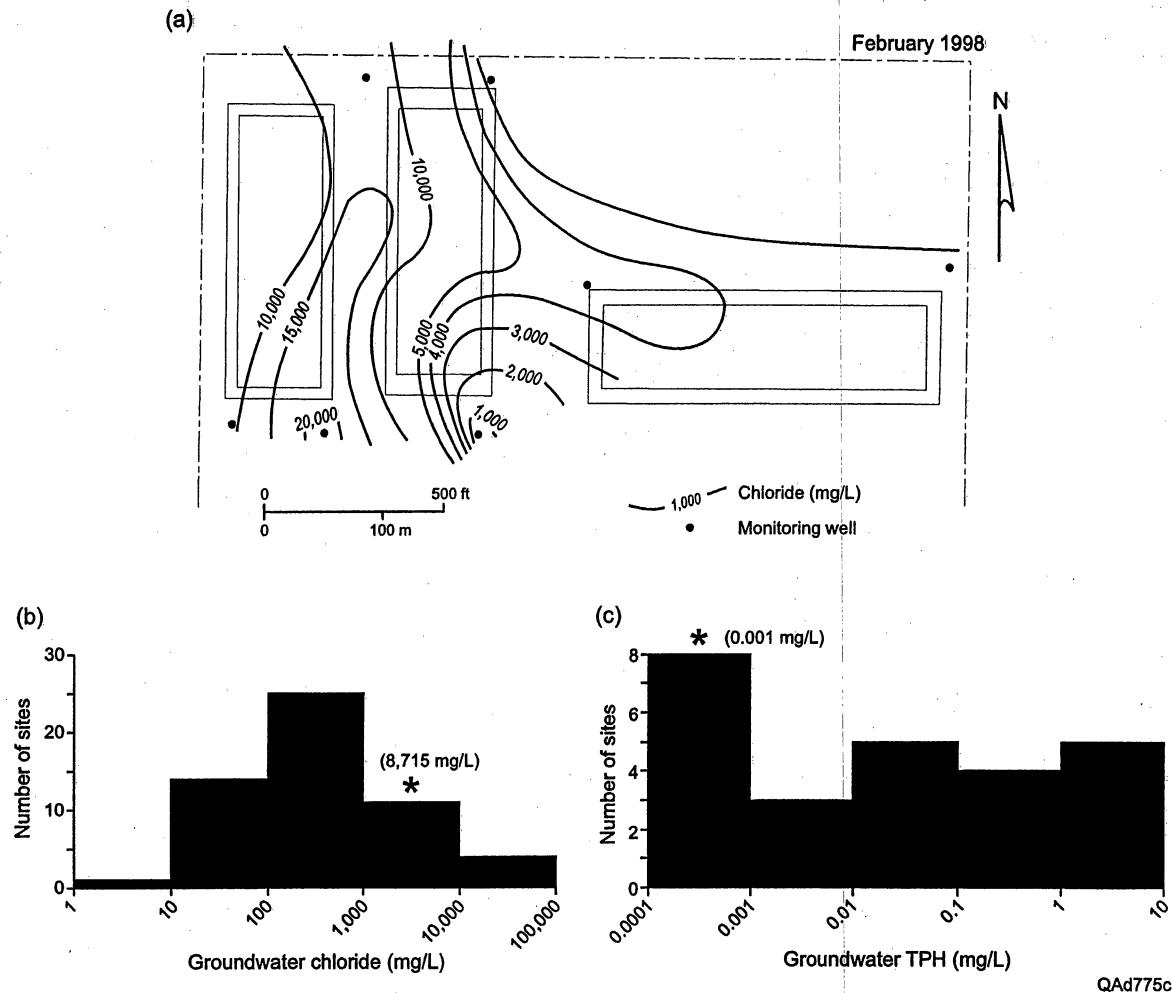

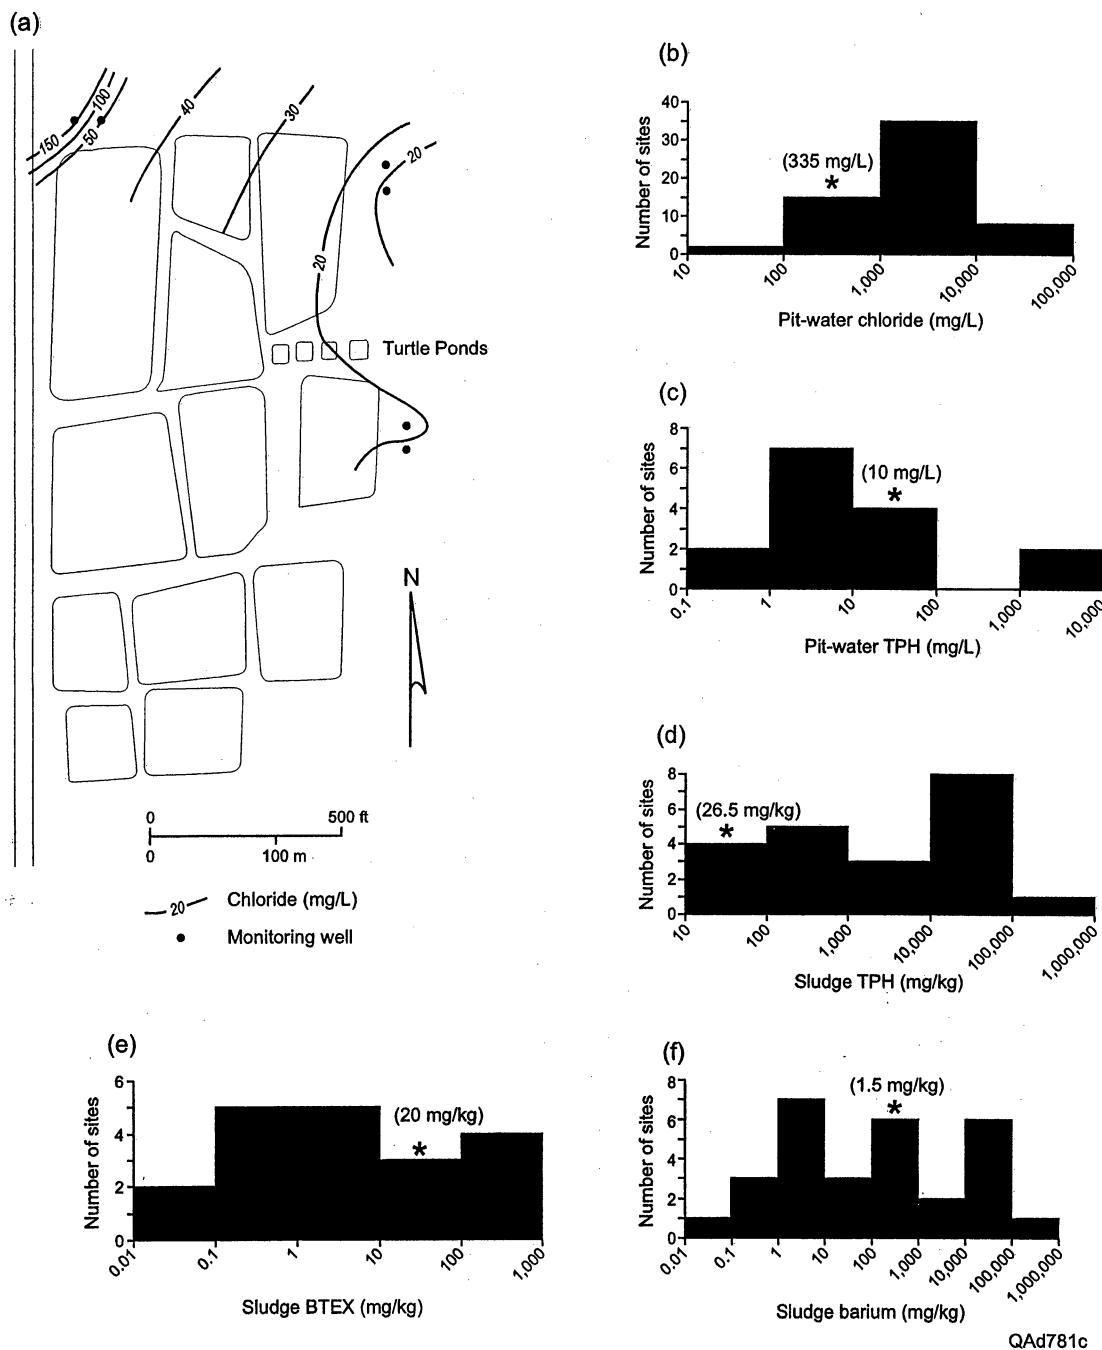

Figure 22. Guard site, Major County, Oklahoma: (a) map shows distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, and (c) mean TPH in groundwater. Histograms in (b) and (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Guard site. Mean concentration for site in parenthesis.

Merkle Site
Pottawatomie County, Oklahoma

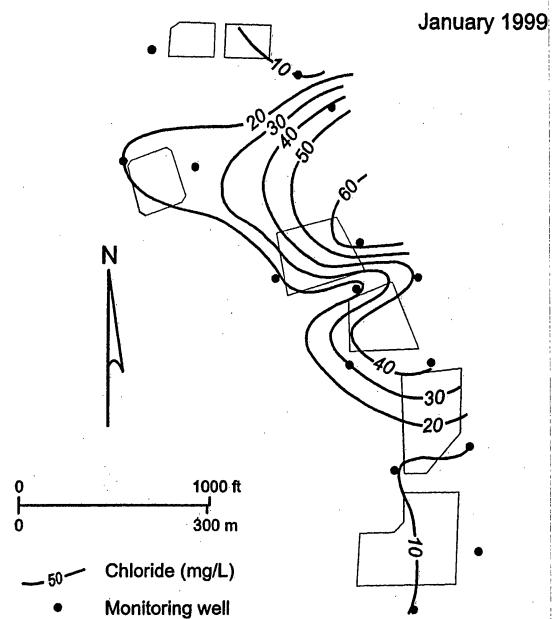

QAd781c

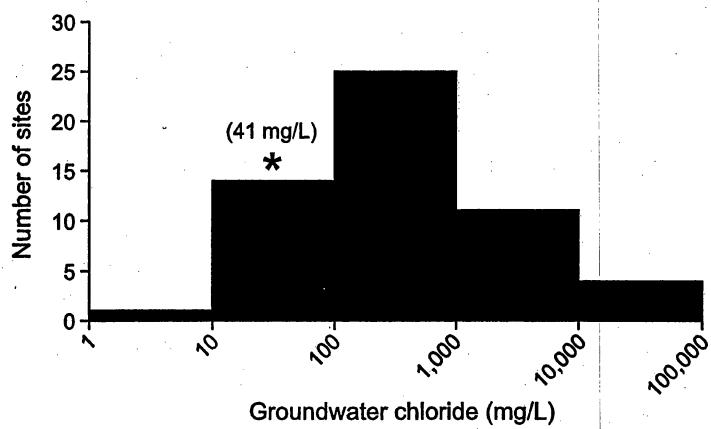

Figure 23. Merkle site, Pottawatomie County, Oklahoma: (a) map shows distribution of chloride in groundwater. Histograms show (b) mean chloride in pit water, (c) mean TPH in pit water, (d) mean TPH in pit sludge, (e) mean BTEX in pit sludge, and (f) mean barium in pit sludge. Histograms in (b) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Merkle site. Mean concentration for site in parentheses.

Safe Earth Site
Roger Mills County, Oklahoma

(a)

(b)

QAd784c

Figure 24. Safe Earth site, Roger Mills County, Oklahoma: maps show (a) distribution of chloride in groundwater, and (b) water levels. Histograms show (c) mean chloride in groundwater. Histograms in (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Safe Earth site. Mean concentration for site in parentheses.

Southard Site
Blaine County, Oklahoma

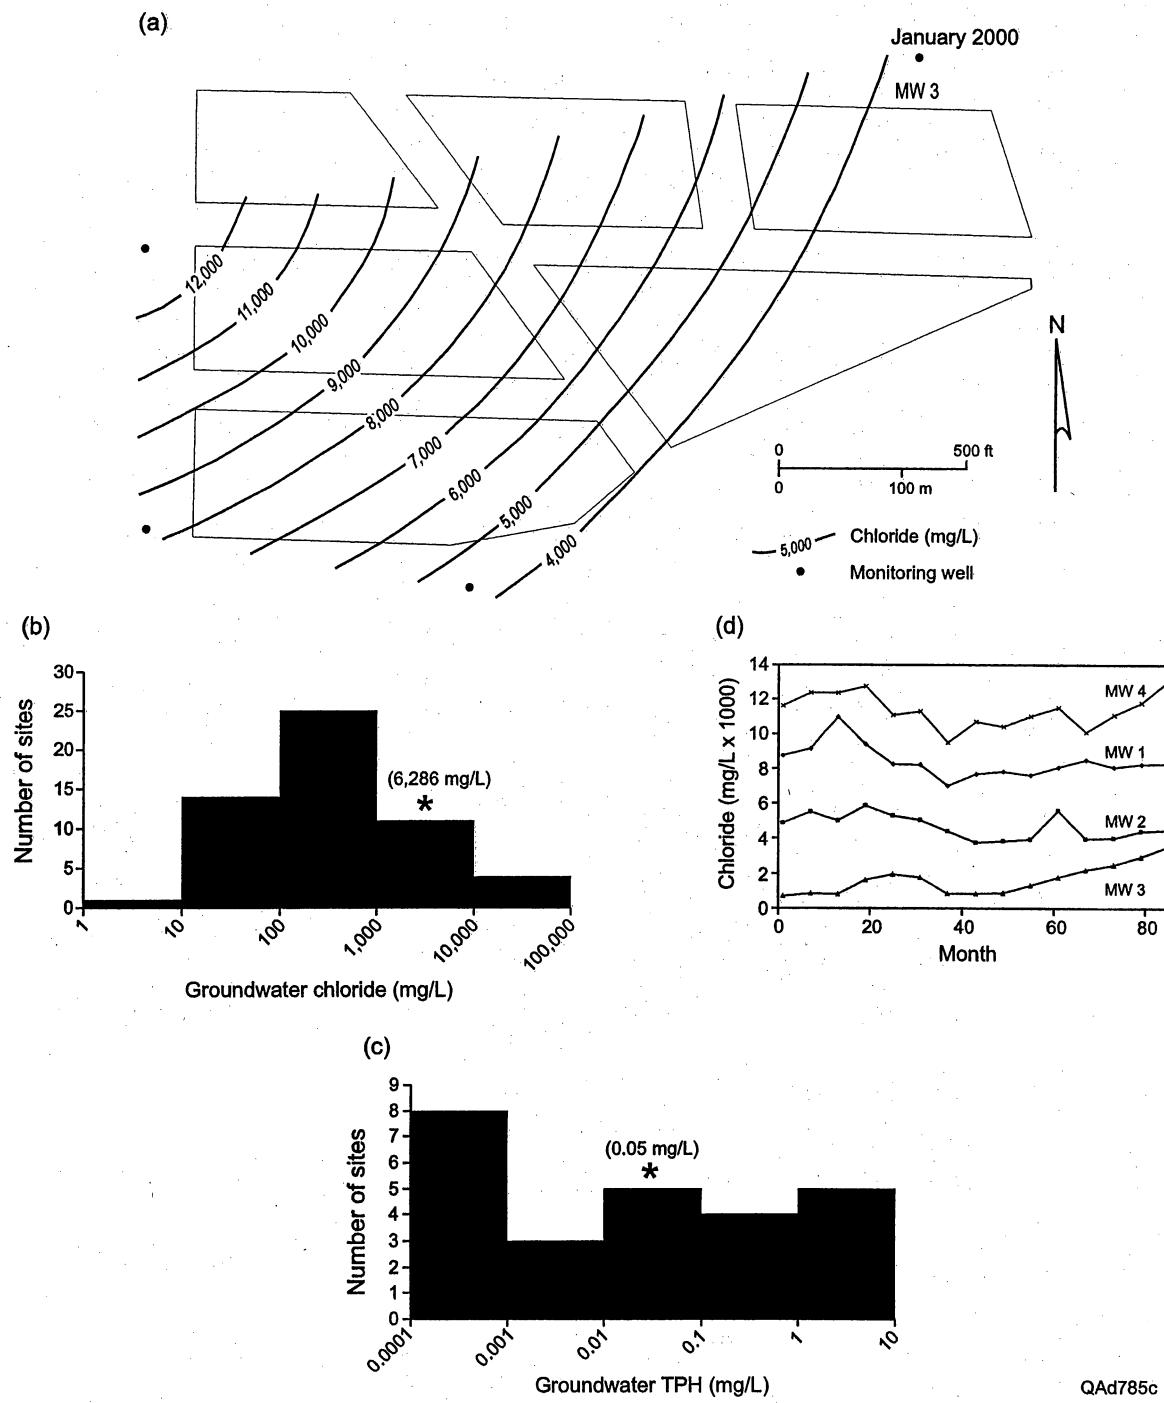

Figure 25. Southard site, Blaine County, Oklahoma: (a) map shows distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, and (c) mean TPH in groundwater. (d) Time-series plot of chloride in groundwater by monitoring wells. Histograms in (b) and (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Southard site. Mean concentration for site in parentheses.

T & S Site
McClain County, Oklahoma

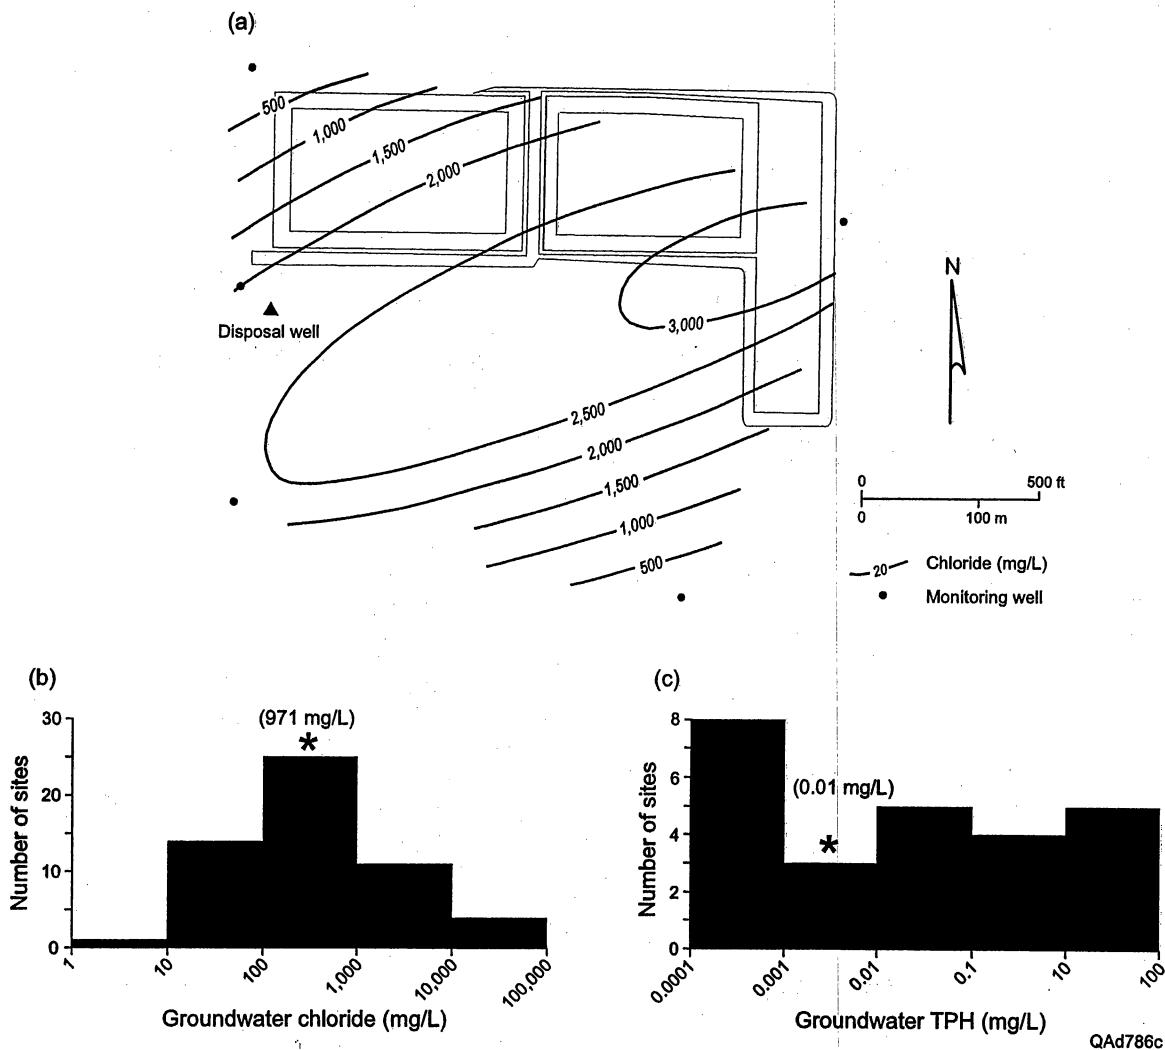

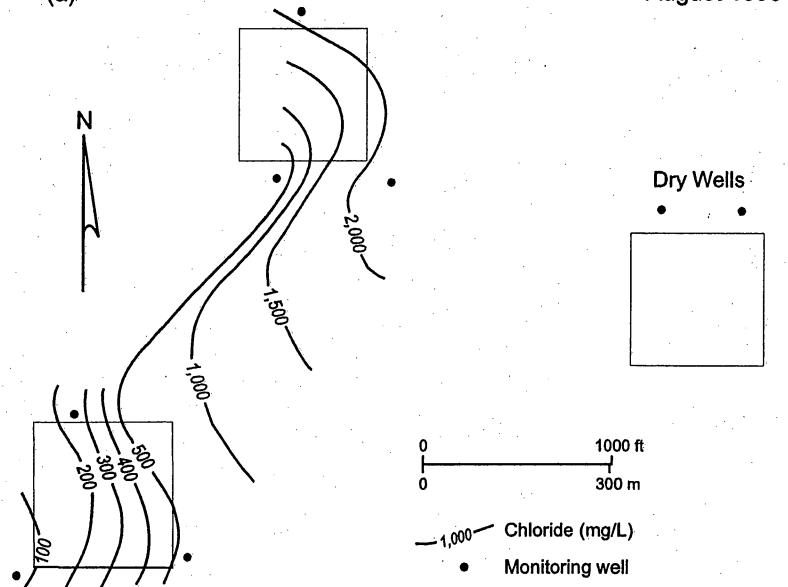

Figure 26. T & S site, McClain County, Oklahoma: (a) map shows distribution of chloride in groundwater. Histograms show (b) mean chloride in groundwater, and (c) mean TPH in groundwater. Histograms in (b) and (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for the T & S site. Mean concentration for site in parentheses.

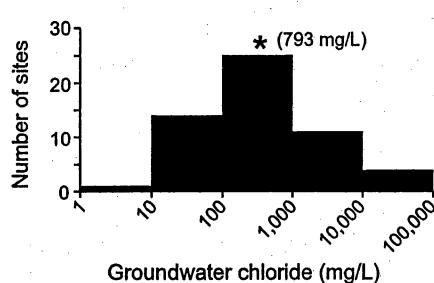

Webb/Femco Site
McCain County, Oklahoma

August 1995

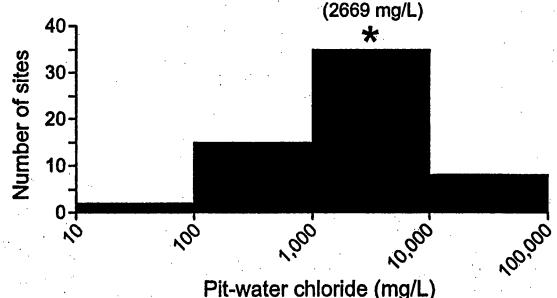

(a)

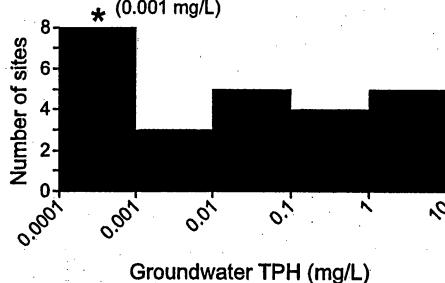

(b)

(d)

(c)

QAd788c

Figure 27. Webb/Femco site, McCain County, Oklahoma: (a) map shows distribution of chloride in groundwater Histograms show (b) mean chloride in groundwater, (c) mean TPH in groundwater, and (d) mean chloride in pit water. Histograms in (b) to (d) for all sites in the study sample (fig. 4). Star (*) indicates mean for the Webb/Femco site. Mean concentration for site in parentheses.

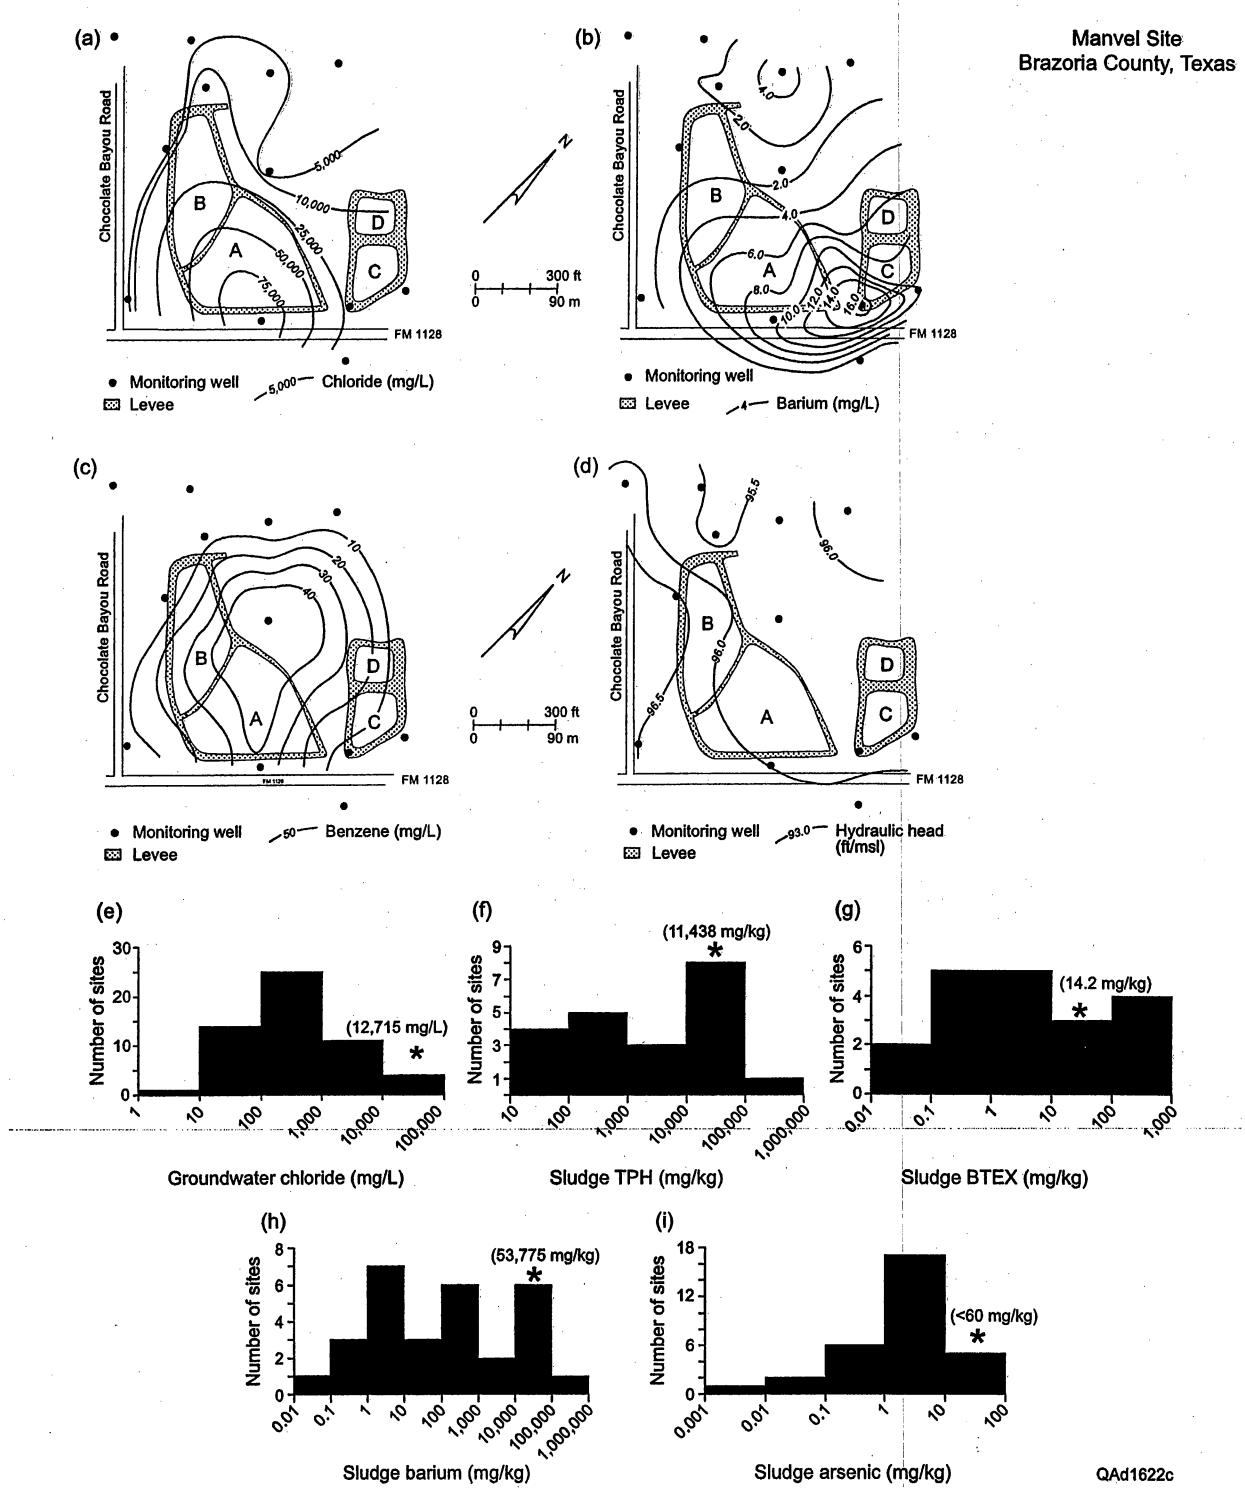

Figure 28. Manvel Saltwater Disposal site, Brazoria County, Texas: maps show (a) distribution of chloride in groundwater, (b) barium in groundwater, (c) benzene in ground water, and (d) water levels. Histograms show (e) mean chloride in groundwater, (f) mean TPH in pit sludge, (g) mean BTEX in pit sludge, (h) mean barium in pit sludge, and (i) mean arsenic in pit sludge. Histograms in (e) to (i) for all sites in the study sample (fig. 4). Star (*) indicates mean for site. Mean concentration for site in parentheses.

**Roeling Vacuum Site
Liberty County, Texas**

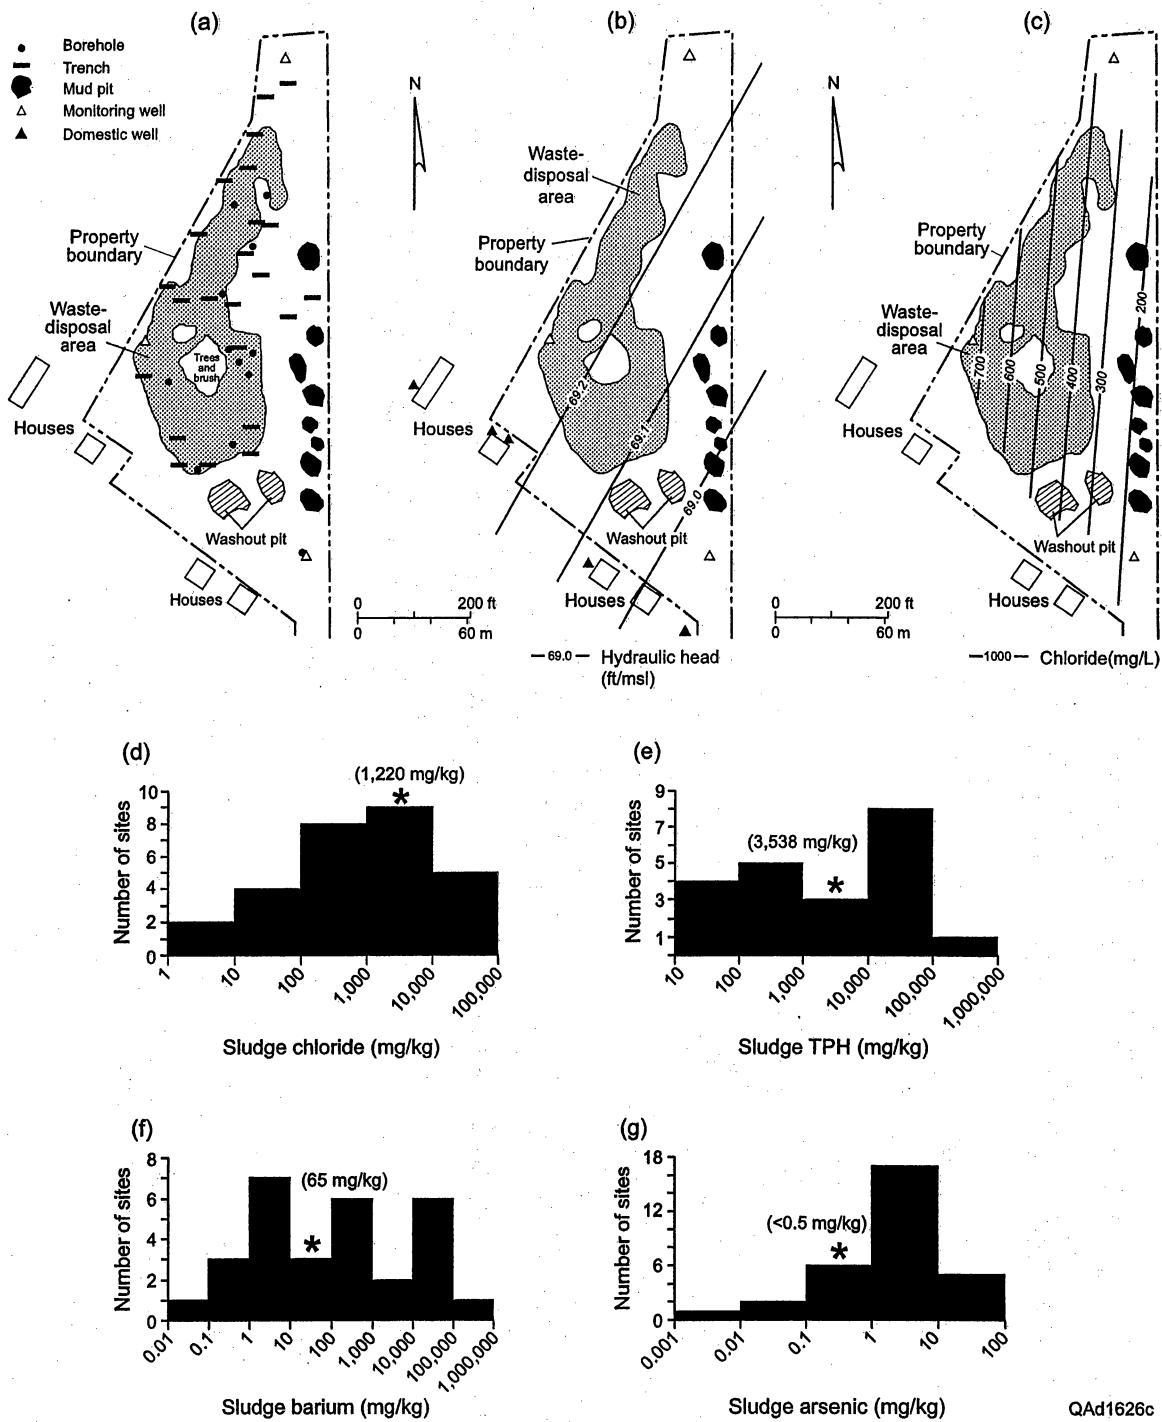

Figure 29. Roeling Vacuum site, Liberty County, Texas: maps of distribution of pits, sample locations, and other site elements, (b) water levels, and (c) chloride in groundwater. Histograms of (d) mean chloride in pit sludge, (e) mean TPH in pit sludge, (f) mean barium in pit sludge, and (g) mean arsenic in pit sludge; (d) to (g) for all sites in the study sample. * mean for Roeling Vacuum site; mean concentration in parentheses.

Steve's Oilfield Services
Kleberg County, Texas

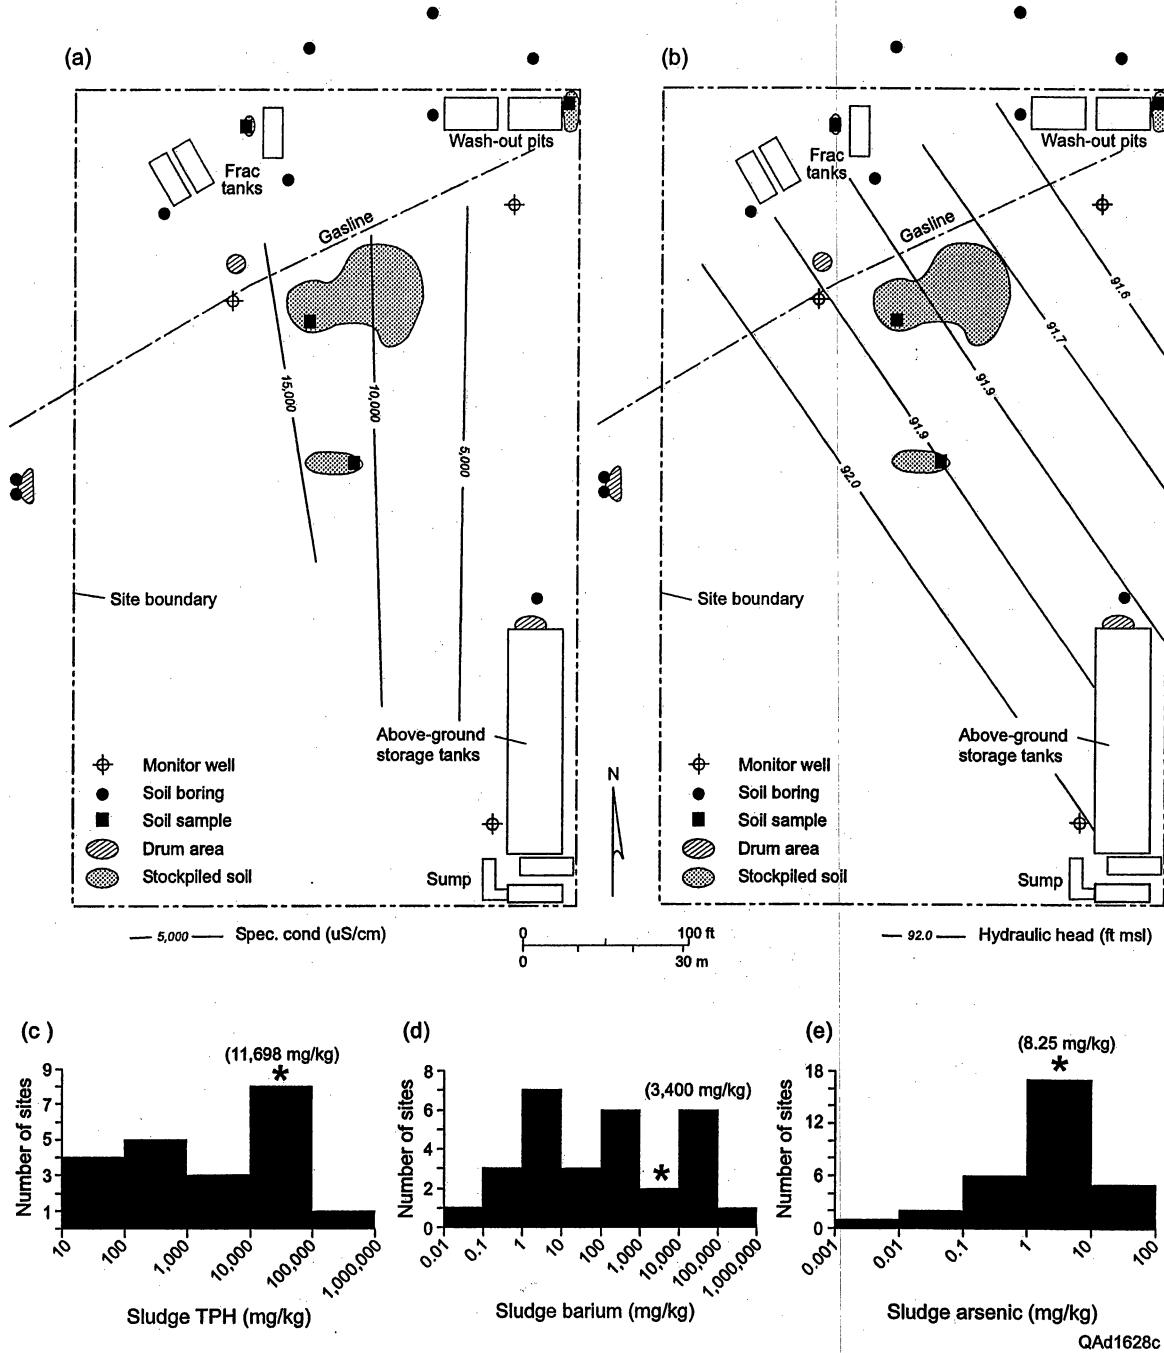

Figure 30. Steve's Oilfield Services site, Kleberg County, Texas: maps show (a) distribution of specific conductance in groundwater, and (b) water levels. Histograms show (c) mean TPH in sludge, (e) mean arsenic in pit sludge, (f) mean barium in pit sludge, and (g) mean arsenic in pit sludge. Histograms in (c) to (g) for all sites in the study sample (fig. 4). Star (*) indicates mean for Steve's site. Mean concentration for site in parentheses.

**Rule Tank Trucks
Haskell County, Texas**

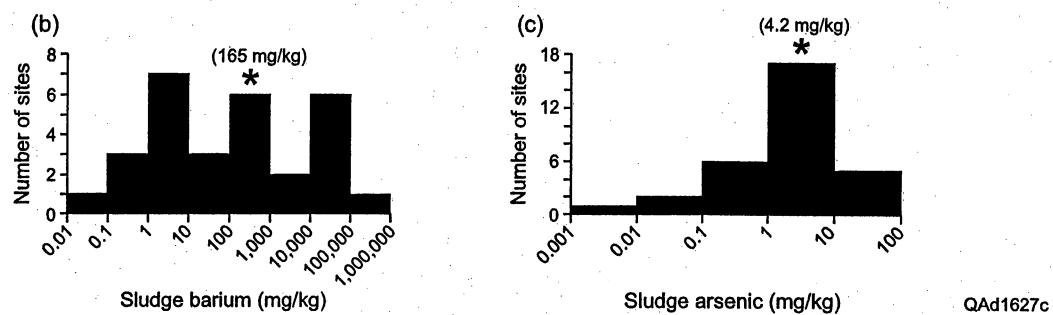

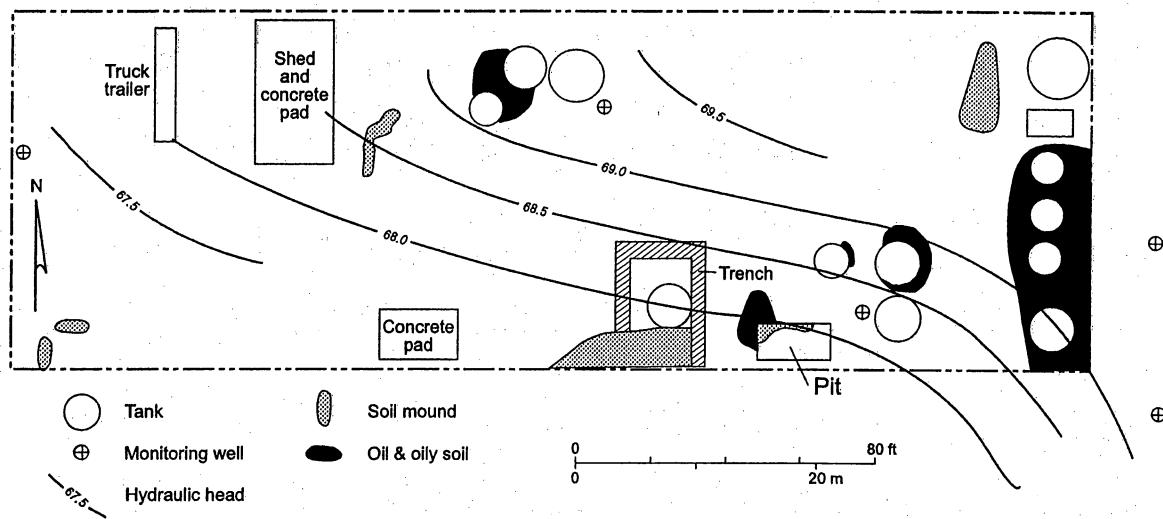

Figure 31. Rule Tank Trucks site, Haskell County, Texas: (a) map shows distribution of pits, oil-contaminated surface areas, water levels, and other site elements. Histograms show (b) mean barium in pit sludge and (c) mean arsenic in sludge. Histogram in (b) and (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for site. Mean concentration for site in parentheses.

Albany Tank Yard
Shackelford County, Texas

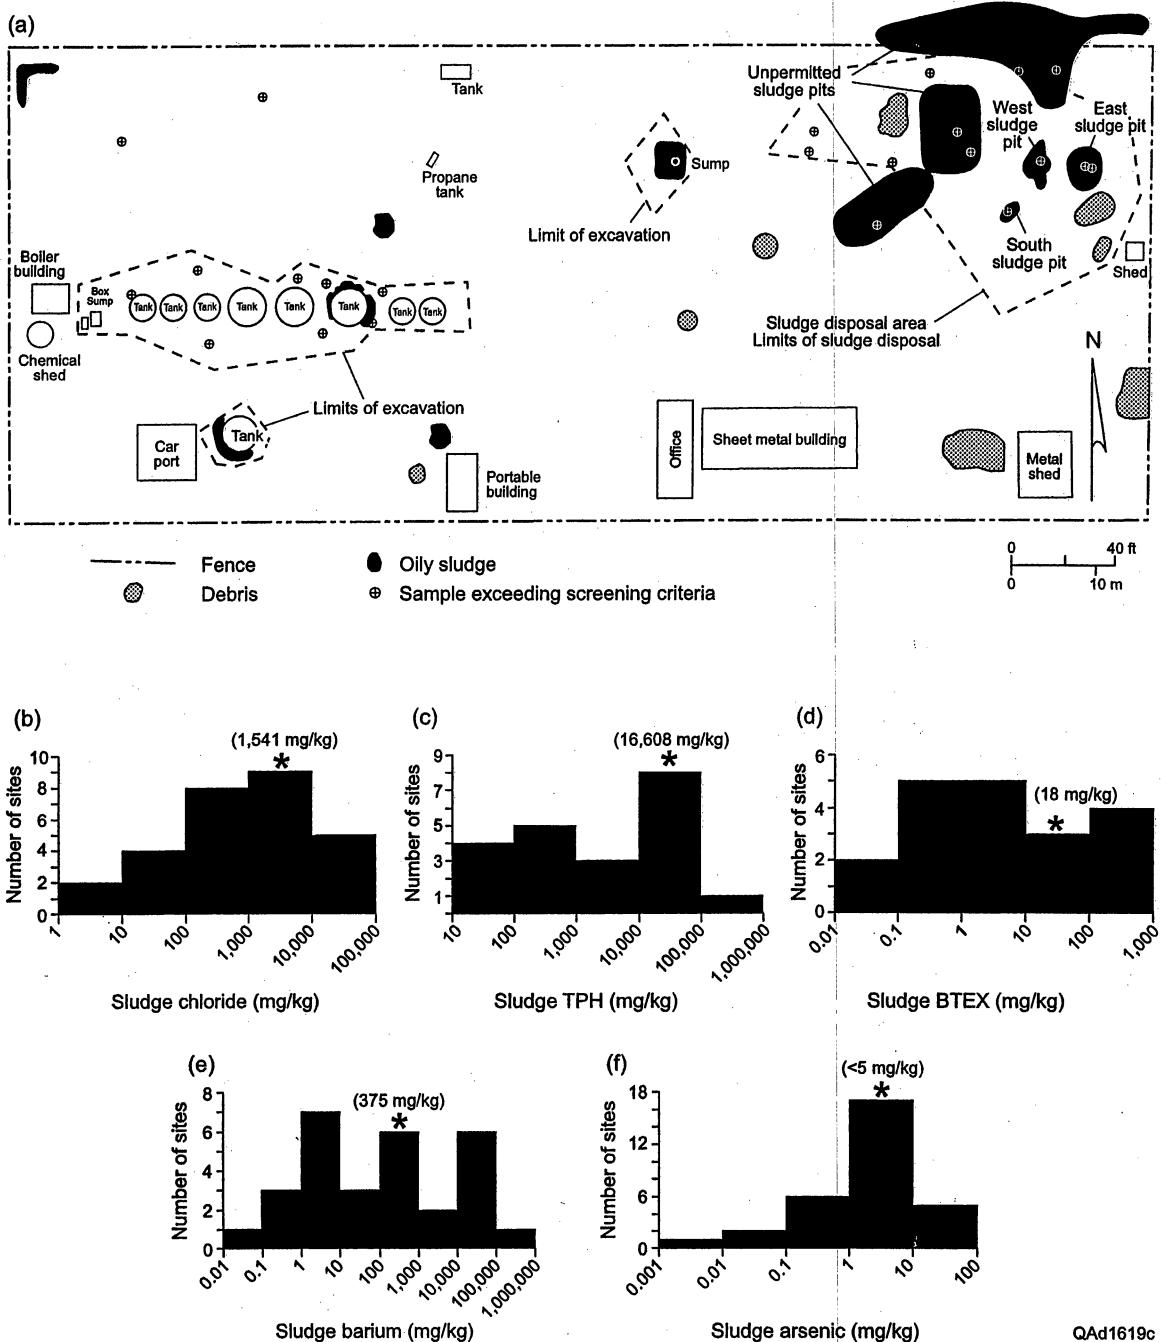

Figure 32. Albany Tank Yard site, Shackelford County, Texas: (a) map shows distribution of various elements of the facility, including pits and hydrocarbon contamination at the surface. Also shown are limits of remedial excavation of contaminated soils. Histograms show (b) mean chloride in sludge, (c) mean TPH in sludge, (d) mean BTEX in sludge, (e) mean barium in sludge, and (f) mean arsenic in sludge. Histograms in (b) to (f) for all sites in the study sample (fig. 4) Star (*) indicates mean for site. Mean concentration for site in parentheses.

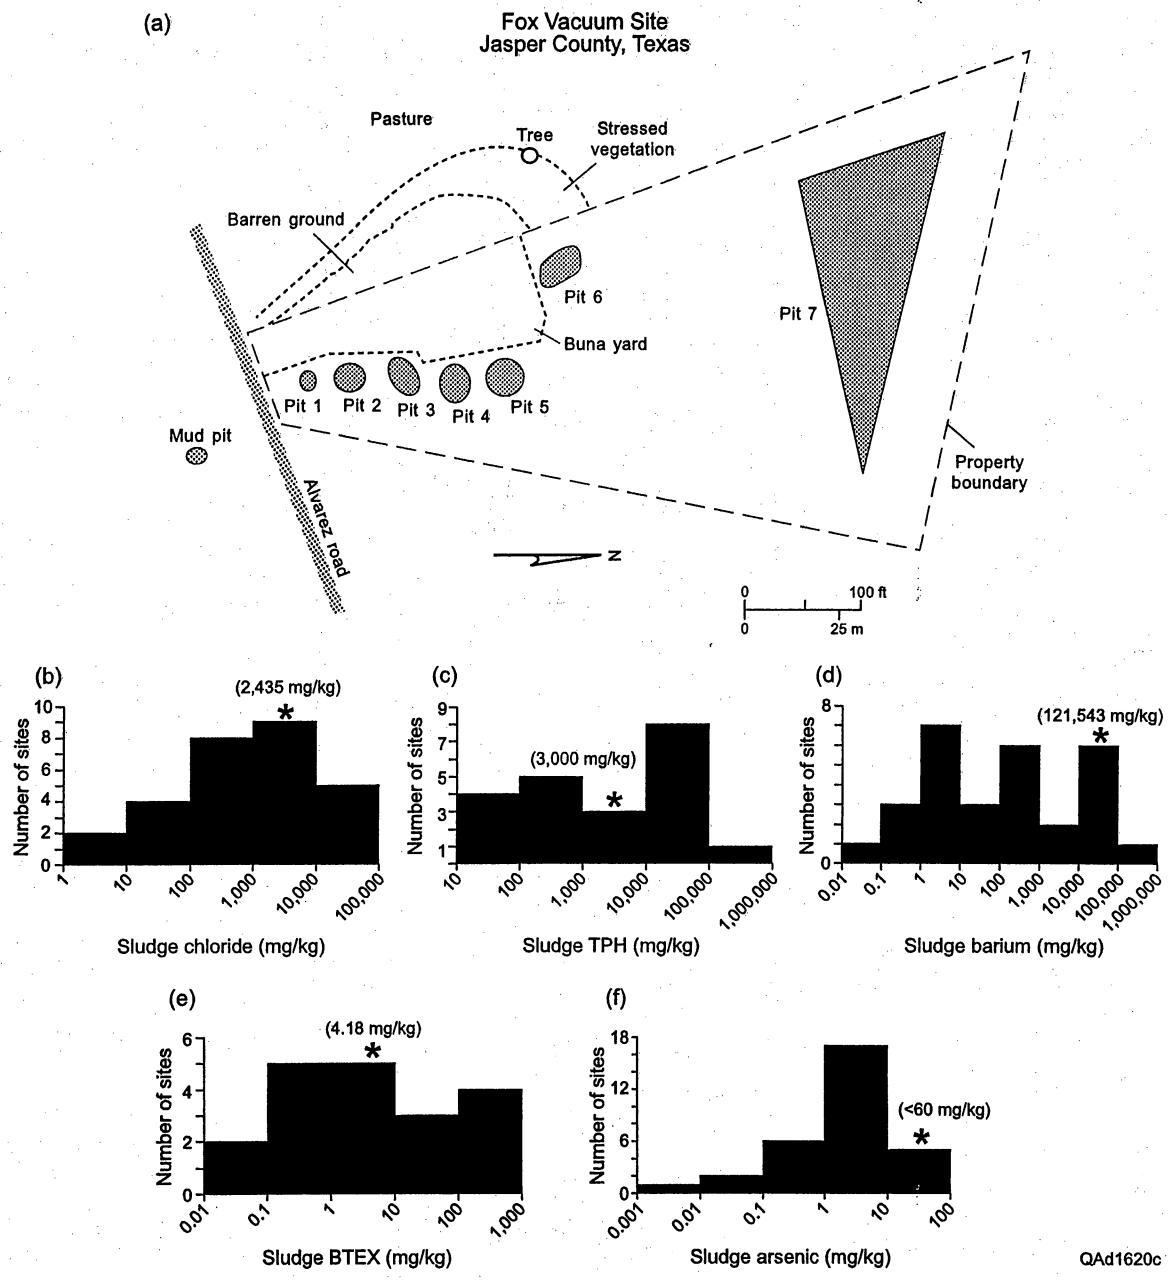

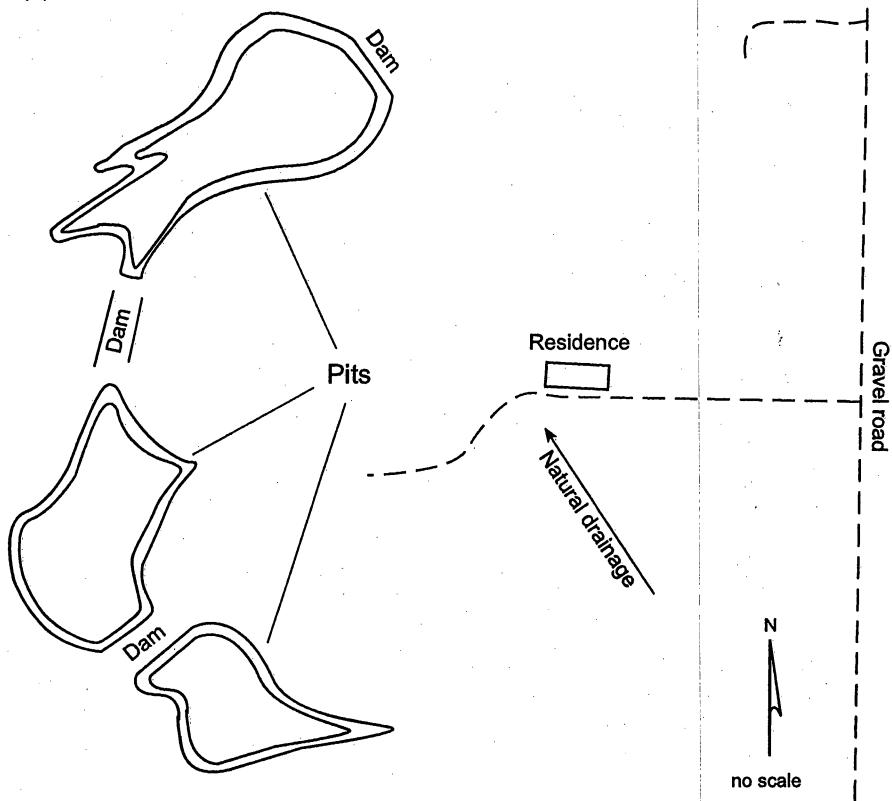

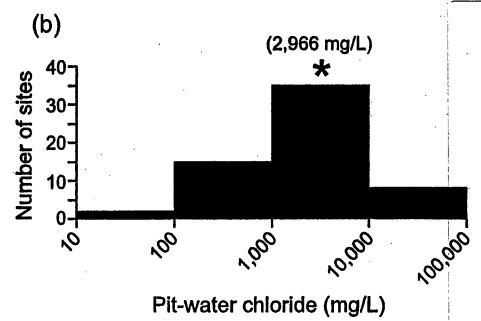

Figure 33. Fox Vacuum site, Jasper County, Texas: (a) map shows distribution of pits and area of barren soil. Histograms show (b) mean chloride in pit sludge, (c) mean TPH in pit sludge, (d) mean barium in pit sludge, (e) mean BTEX in pit sludge, and (f) mean barium in pit sludge. Histograms in (b) to (f) for all sites in the study sample (fig. 4). Star (*) indicates mean for site. Mean concentration for site in parentheses.

Gober Disposal Site
Wise County, Texas

(a)

(b)

QAd1621c

Figure 34. Gober Disposal site, Wise County, Texas: (a) map shows distribution of pits and natural direction of drainage. Histogram shows (b) mean chloride in pit water. Histogram in (b) for all sites in the study sample (fig. 4). Star (*) indicates mean for site. Mean concentration for site in parentheses.

Robert Munson Site
Burleson County, Texas

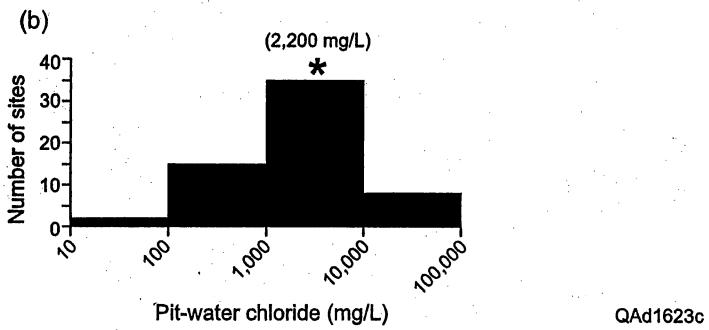

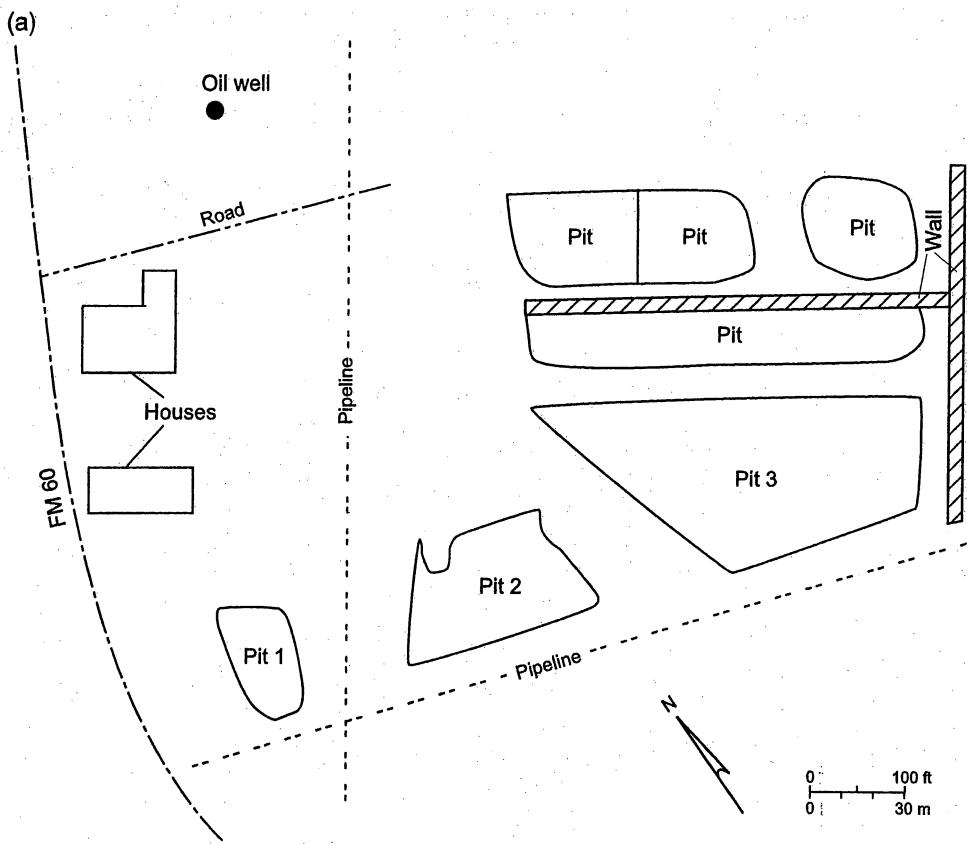

Figure 35. Robert Munson site, Burleson County, Texas: (a) map shows distribution of permitted pits (1, 2, and 3), non-permitted pits, and other site elements. Histogram shows mean chloride in pit water (b). Histogram in (b) for all sites in the study sample (fig. 4). Star (*) indicates mean for site. Mean concentration for site in parentheses.

Red River Oilfield Services
Wilbarger County, Texas

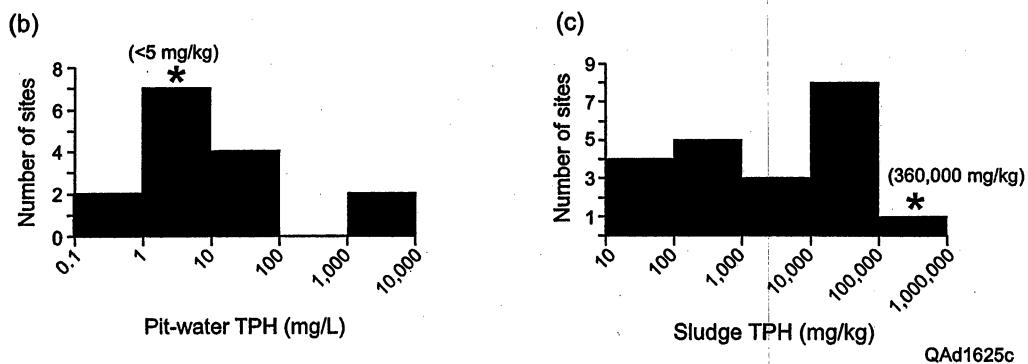

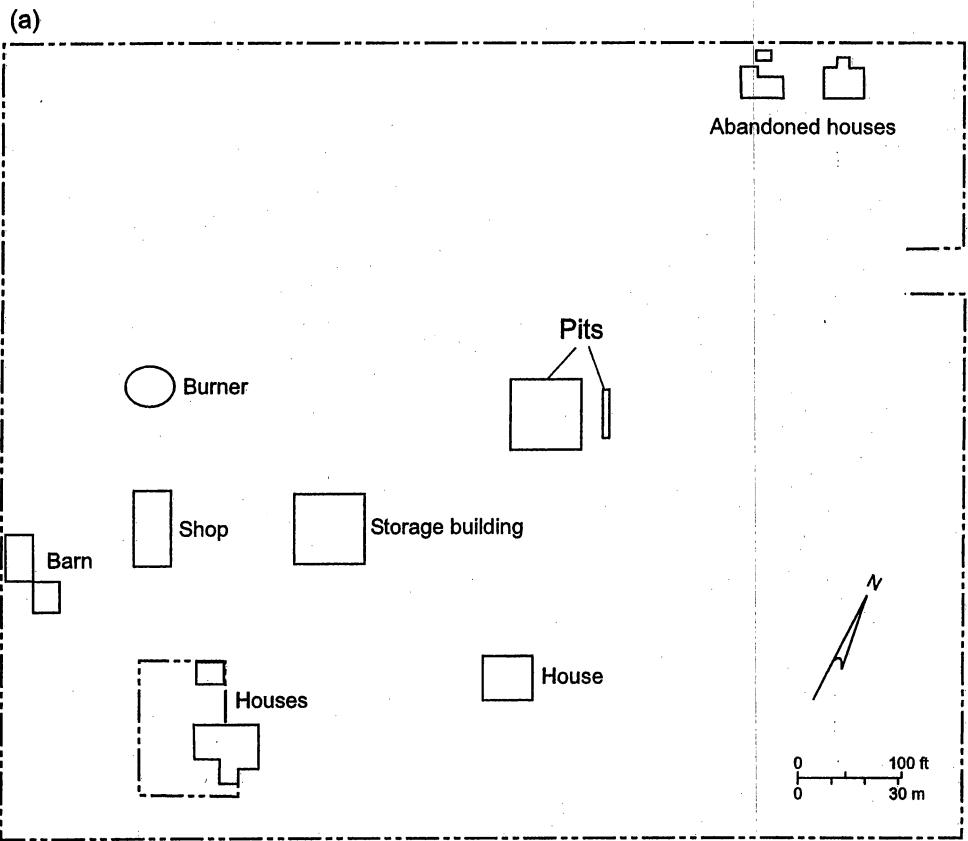

Figure 36. Red River Oilfield Services site, Wilbarger County, Texas: (a) map shows distribution of pits and other site elements. Histograms show (b) mean TPH in pit water and (c) mean TPH in sludge. Histogram in (b) and (c) for all sites in the study sample (fig. 4). Star (*) indicates mean for site. Mean concentration for site in parentheses.

Table 1. Data availability for drilling-fluid disposal sites in Louisiana, New Mexico, Oklahoma, and Texas.

Site summary

Number of sites in database:	286
Active as of January 2002:	55
Inactive as of January 2002:	197
Abandoned:	34
Disposal-pit facilities:	274
Land-treatment facilities:	12

Data summary

Data type	No. of sites providing data
No. of pits or no. of cells per site	218
Area of pits or cells	215
Site map	34
Monitor-well map	21
Pit or cell sludge analyses	62
Pit or cell (sump) water analyses	75
Analyses of chemical composition of groundwater	64
Groundwater level measurements	15
Monitoring-well time series data*	24
Waste volume received**	21
Geotechnical data (liner permeability)	16
Analytical methods specified	41
Abandoned-site assessment data	22
Abandoned-site remediation data	3

* Monitor-well time-series data include records collected for ≥ 2 yr

** Generally continuous record over several years

Table 2. Number of sites in database with records on chemical analyses of sludge, pit water, or groundwater. Listed by medium and constituent.

Constituent	Pit Sludge	Pit Water	Groundwater
Aluminum	4	3	2
Antimony	7	3	3
