

CPSeis -Open-Source Seismic Processing - How it is Used, Lessons Learned
Bill Menger, Weinman Geoscience

ConocoPhillips open-sourced its processing system (CPS) in late 2007. This presentation describes the processes required for this, describes the problems encountered while managing the project, and how CPSeis is being used in the industry. It will focus on these areas:

- 1Getting permission
- 2Understanding the ROI (return on investment)
- 3Setting your sights on the end-game
- 4Deciding on your target platforms
- 5Dealing with the issues that arise
- 6Managing “legacy” software without losing your mind

I will also introduce another ConocoPhillips open source package, GeoCraft, and will describe the differences between these two projects.
